## Common Corporate Finance Exam Question Categories

Corporate finance exams typically cover a broad spectrum of topics. Understanding the different categories of questions you might encounter will help you tailor your study approach. Let's break down some of the most common areas:

## 1. Valuation Techniques

This is often the heart of corporate finance. You'll be asked to determine the intrinsic value of a company, a stock, or a project.

1. **Discounted Cash Flow (DCF) Analysis:** This is a cornerstone. Expect questions that require you to project future cash flows and discount them back to the present using a weighted average cost of capital (WACC). This involves understanding free cash flow to firm (FCFF) and free cash flow to equity (FCFE).
2. **Relative Valuation:** Using multiples (like P/E, EV/EBITDA) of comparable companies to estimate the value of your target company.
3. **Asset-Based Valuation:** Determining the value of a company by summing up the market value of its individual assets minus its liabilities. This is less common for going concerns but important for liquidation scenarios.

## 2. Cost of Capital

How much does it cost a company to raise funds? This is critical for investment decisions.

1. **Weighted Average Cost of Capital (WACC):** Calculating the average cost of all the capital a company uses, weighted by the proportion of each type of capital (debt and equity). This often involves understanding the cost of debt (after-tax) and the cost of equity (using models like CAPM).
2. **Cost of Equity:** Determining the return a company requires to compensate its equity investors, typically calculated using the Capital Asset Pricing Model (CAPM).
3. **Cost of Debt:** The effective rate a company pays on its borrowed funds, usually adjusted for taxes since interest payments are tax-deductible.

### 3. Capital Budgeting and Investment Decisions

Should a company undertake a new project? This is where valuation meets strategy.

1. **Net Present Value (NPV):** A project is acceptable if its NPV is positive, meaning it's expected to add value to the company.
2. **Internal Rate of Return (IRR):** The discount rate at which the NPV of a project equals zero. If the IRR is greater than the company's cost of capital, the project is generally accepted.
3. **Payback Period:** How long it takes for an investment to generate enough cash flow to recover its initial cost. This is a simpler metric but doesn't account for cash flows beyond the payback period.
4. **Profitability Index (PI):** The ratio of the present value of future cash flows to the initial investment. A PI greater than 1 indicates a desirable project.

### 4. Capital Structure and Financing Decisions

How should a company finance its operations and growth?

1. **Debt vs. Equity:** Understanding the trade-offs between using debt (borrowing) and equity (selling ownership stakes) to raise capital.
2. **Modigliani-Miller Theorems:** Theoretical frameworks on the impact of capital structure on firm value under various assumptions.
3. **Optimal Capital Structure:** The mix of debt and equity that minimizes the firm's WACC and maximizes its value.
4. **Issuing Debt and Equity:** Understanding the processes and implications of issuing bonds or shares.

### 5. Working Capital Management

This focuses on the efficient management of a company's short-

term assets and liabilities.

1. **Cash Conversion Cycle (CCC):** Measuring the time it takes for a company to convert its investments in inventory and other resources into cash flows from sales.
2. **Inventory Management:** Techniques like EOQ (Economic Order Quantity) and JIT (Just-In-Time).
3. **Receivables Management:** Strategies to speed up cash collection from customers.
4. **Payables Management:** Strategies to optimize payments to suppliers.

## 6. Dividend Policy

How should a company distribute profits to its shareholders?

1. **Dividend Irrelevance Theory:** Arguing that dividend policy doesn't affect firm value.
2. **Bird-in-Hand Theory:** Investors prefer current dividends over uncertain future capital gains.
3. **Tax Preference Theory:** Investors may prefer capital gains over dividends due to tax advantages.
4. **Clientele Effect:** Different groups of investors prefer different dividend payout ratios.

## 7. Mergers and Acquisitions (M&A)

This involves understanding the financial aspects of combining companies.

1. **Valuation in M&A:** Determining the fair price for an acquisition target.
2. **Financing M&A:** How the deal will be paid for.
3. **Synergies:** The expected benefits from combining two companies.

# Strategies for Tackling Corporate Finance Exam Questions

Now that we know what to expect, let's talk about *how* to approach these questions effectively. It's not just about memorizing formulas; it's about understanding the underlying logic and being able to apply it.

## 1. Deconstruct the Question

This is perhaps the most critical first step.

1. **Read Carefully:** Don't skim! Identify all the given information, the specific question being asked, and any constraints or assumptions.
2. **Identify Key Information:** Underline or highlight crucial numbers, percentages, time periods, and financial metrics.
3. **Determine the Core Concept:** What area of corporate finance is this question testing? Valuation? Cost of capital? Capital budgeting? This will guide your approach.

## 2. Choose the Right Tools (Formulas and Models)

Once you understand the question, select the appropriate financial tools.

1. **Formula Sheet Mastery:** If you're allowed a formula sheet, know it inside and out. Understand what each variable represents.
2. **Recall and Adapt:** For many questions, you'll need to recall standard formulas. For others, you might need to adapt a basic formula to fit the specific scenario. For example, a DCF problem might require you to calculate FCFF from net income, which involves adding back depreciation and tax shields on interest.

### 3. Step-by-Step Problem Solving

Break down complex problems into manageable steps.

1. **Organize Your Work:** Use clear headings or bullet points for each step. This helps you stay on track and makes your solution easier to follow and grade.
2. **Show Your Work:** Even if you know the answer, clearly demonstrate how you arrived at it. This is crucial for partial credit and for identifying where you might have made a mistake.
3. **Check Your Units:** Are you working with millions, thousands, percentages, or absolute dollar amounts? Consistency is key.
4. **Perform Sanity Checks:** Does your answer make sense in the context of the problem? If you calculate a stock price of \$1,000,000 for a small local bakery, something is likely wrong!

### 4. Practice, Practice, Practice!

There's no substitute for hands-on experience.

1. **Work Through Textbook Examples:** Start with the solved examples in your textbook.
2. **Solve End-of-Chapter Problems:** Aim to solve as many as you can.
3. **Use Past Exams:** If available, past exams are invaluable for understanding the exam format, question difficulty, and common themes.
4. **Form Study Groups:** Discussing problems with peers can offer new perspectives and solidify your understanding.

## Illustrative Corporate Finance Exam Questions and Solutions

Let's walk through a couple of common scenarios to illustrate the

application of these strategies.

### Scenario 1: Discounted Cash Flow (DCF) Valuation

**Question:** "XYZ Corp. is expected to generate free cash flows of \$10 million in year 1, \$12 million in year 2, and \$15 million in year 3. After year 3, the company's free cash flows are expected to grow at a perpetual rate of 5% per year. The company's weighted average cost of capital (WACC) is 10%. Calculate the enterprise value of XYZ Corp."

**Solution Approach:** 1. **Deconstruct:** \* Cash flows: \$10M (Yr 1), \$12M (Yr 2), \$15M (Yr 3). \* Perpetual growth rate: 5%. \* WACC: 10%. \* Goal: Enterprise Value. 2. **Tools:** DCF formula, Gordon Growth Model (for terminal value). 3. **Steps:** \* **Step 1:** Calculate the present value of explicit free cash flows. \*  $PV(Yr\ 1) = \$10M / (1 + 0.10)^1 = \$9.09M$  \*  $PV(Yr\ 2) = \$12M / (1 + 0.10)^2 = \$9.92M$  \*  $PV(Yr\ 3) = \$15M / (1 + 0.10)^3 = \$11.27M$  \* Sum of PV of explicit FCFs =  $\$9.09M + \$9.92M + \$11.27M = \$30.28M$  \* **Step 2:** Calculate the terminal value at the end of year 3. \* The cash flow in year 4 (the first year of perpetual growth) will be  $FCFF(Year\ 3) * (1 + growth\ rate) = \$15M * (1 + 0.05) = \$15.75M$ . \* Terminal Value (Year 3) = Cash Flow (Year 4) / (WACC - growth rate) \* Terminal Value (Year 3) =  $\$15.75M / (0.10 - 0.05) = \$15.75M / 0.05 = \$315M$  \* **Step 3:** Calculate the present value of the terminal value. \*  $PV\ of\ Terminal\ Value = Terminal\ Value\ (Year\ 3) / (1 + WACC)^3$  \*  $PV\ of\ Terminal\ Value = \$315M / (1 + 0.10)^3 = \$315M / 1.331 = \$236.66M$  \* **Step 4:** Calculate the Enterprise Value. \*  $Enterprise\ Value = Sum\ of\ PV\ of\ explicit\ FCFs + PV\ of\ Terminal\ Value$  \*  $Enterprise\ Value = \$30.28M + \$236.66M = \$266.94M$  \* **Sanity Check:** The terminal value represents a significant portion of the total value, which is typical for companies with a stable perpetual growth rate. The numbers seem reasonable given the inputs.

## Scenario 2: Capital Asset Pricing Model (CAPM) for Cost of Equity

**Question:** "Alpha Corp. has a beta of 1.2. The risk-free rate of return is 3%, and the expected market risk premium is 7%. Calculate the cost of equity for Alpha Corp."

**Solution Approach:**

- Deconstruct:**
  - Beta ( $\beta$ ): 1.2
  - Risk-Free Rate ( $R_f$ ): 3%
  - Market Risk Premium (MRP): 7% (Note: Market Risk Premium = Expected Market Return - Risk-Free Rate)
- Goal:** Cost of Equity ( $R_e$ ).
- Tools:** Capital Asset Pricing Model (CAPM) formula.
$$R_e = R_f + \beta * (R_m - R_f)$$
Where  $(R_m - R_f)$  is the Market Risk Premium (MRP). So,
$$R_e = R_f + \beta * MRP$$
- Steps:**
  - Plug the values into the CAPM formula:
$$R_e = 3\% + 1.2 * 7\%$$
$$R_e = 3\% + 8.4\%$$
$$R_e = 11.4\%$$

**Sanity Check:** A beta greater than 1 indicates that Alpha Corp. is more volatile than the market. Therefore, its cost of equity should be higher than the market risk premium plus the risk-free rate, which it is ( $11.4\% > 3\% + 7\%$ ). The calculation is straightforward and the result is a plausible cost of equity.

## **Deconstructing Corporate Finance Exam Questions: Strategies for Success**

**Approaching corporate finance exam questions strategically can make a significant difference in your performance. Here's a breakdown of effective techniques:**

### **1. Active Reading and Understanding the Question**

**Before you even think about formulas, read the question carefully. Identify what is being asked, what information is provided, and what needs to be**

## **2. Identifying the Relevant Financial Concepts**

**Once you understand the question, pinpoint the core corporate finance concept it relates to. Is it a valuation problem? A capital budgeting decision? A working capital calculation? Recognizing the underlying principle will guide your choice of formulas and**

**analytical approach.**

### **3. Structuring Your Solution**

**For numerical problems, it's best to adopt a structured approach.**

**This not only helps you stay organized but also makes your solution clear and easy for the examiner to follow. A good structure typically includes:**

- 1. Identify Given Information: List all the variables and their values provided in the question.**
- 2. State the Formula(s): Clearly write down the formula(s) you will use.**
- 3. Show Your Work: Substitute the given values into the formula**

**and show each step of your calculation. This is crucial for partial credit, even if you make a final arithmetic error.**

- 4. State the Final Answer: Clearly present your final answer, including units (e.g., dollars, percentage).**
- 5. Provide Interpretation (if required): For investment decisions, interpret the results (e.g., "The project should be accepted because the NPV is positive").**

#### **4. Utilizing Formulas and Financial Calculators**

**Have a solid grasp of the essential corporate finance formulas. Many**

**exams allow the use of financial calculators, which can significantly speed up calculations for TVM, NPV, and IRR. However, ensure you understand how to use your calculator correctly and are familiar with its functions.**

## **5. Checking Your Work**

**If time permits, review your calculations. Double-check for simple arithmetic errors or incorrect formula application. For conceptual questions, ensure your reasoning is logical and well-supported.**

# **Illustrative Corporate Finance Exam Questions and Solutions**

**Let's walk through a few example [corporate finance exam questions](#) to illustrate these principles. These examples cover common topics and demonstrate a structured approach to finding [exam question solutions](#).**

## **Example 1: Time Value of Money (Present Value of a Single Sum)**

### **Question:**

**You are considering investing \$1,000 today in a project that promises to pay you \$1,500 in 5 years. If your required rate of**

**return is 8% per annum, should you undertake this investment?**

**Solution:**

**This question requires us to calculate the present value (PV) of the future cash inflow and compare it to the initial investment.**

**Given Information:**

- 1. Future Value (FV) = \$1,500**
- 2. Number of periods (n) = 5 years**
- 3. Discount rate (r) = 8% or 0.08**
- 4. Initial Investment = \$1,000**

**Formula:**

**The formula for the present value**

**of a single sum is:**

$$\text{PV} = \text{FV} / (1 + r)^n$$

**Calculation:**

$$\text{PV} = \$1,500 / (1 + 0.08)^5$$

$$\text{PV} = \$1,500 / (1.08)^5$$

$$\text{PV} = \$1,500 / 1.469328$$

$$\text{PV} \approx \$1,020.87$$

**Final Answer and Interpretation:**

**The present value of the future cash inflow is approximately \$1,020.87. Since the PV (\$1,020.87) is greater than the initial investment (\$1,000), undertaking this investment is financially attractive. You should accept the project.**

## **Example 2: Capital Budgeting (Net Present Value - NPV)**

### **Question:**

**A company is considering a project with an initial investment of \$50,000. The project is expected to generate cash flows of \$15,000, \$20,000, and \$25,000 at the end of years 1, 2, and 3, respectively. The company's WACC is 10%. Calculate the NPV of the project.**

### **Solution:**

**This question requires us to calculate the Net Present Value (NPV) of the project to determine**

**its profitability.**

**Given Information:**

- 1. Initial Investment (Year 0) = -  
\$50,000**
- 2. Cash Flow Year 1 (CF1) =  
\$15,000**
- 3. Cash Flow Year 2 (CF2) =  
\$20,000**
- 4. Cash Flow Year 3 (CF3) =  
\$25,000**
- 5. Discount Rate (WACC) = 10% or  
0.10**

**Formula:**

**The formula for NPV is:**

$$\text{NPV} = \sum [\text{CF}_t / (1 + r)^t] - \text{Initial Investment}$$

**Where t is the time period.**

**Calculation:**

$$\text{PV of CF1} = \$15,000 / (1 + 0.10)^1 = \$15,000 / 1.10 \approx \$13,636.36$$

$$\text{PV of CF2} = \$20,000 / (1 + 0.10)^2 = \$20,000 / 1.21 \approx \$16,528.93$$

$$\text{PV of CF3} = \$25,000 / (1 + 0.10)^3 = \$25,000 / 1.331 \approx \$18,782.87$$

$$\text{Total PV of Cash Inflows} = \$13,636.36 + \$16,528.93 + \$18,782.87 \approx \$48,948.16$$

**NPV = Total PV of Cash Inflows - Initial Investment**

$$\text{NPV} = \$48,948.16 - \$50,000$$

$$\text{NPV} \approx -\$1,051.84$$

**Final Answer and Interpretation:**

**The Net Present Value (NPV) of the project is approximately - \$1,051.84. Since the NPV is negative, the project is expected to decrease the value of the firm and should be rejected.**

**Example 3: Cost of Capital (Calculating WACC)**

**Question:**

**Apex Corporation has the following capital structure: 60% debt, 10% preferred stock, and 30% common equity. The cost of**

**debt is 7%, the cost of preferred stock is 12%, and the cost of common equity is 15%. The company's tax rate is 25%. Calculate the Weighted Average Cost of Capital (WACC).**

**Solution:**

**This question requires us to calculate the WACC, which represents the average cost of financing for the company.**

**Given Information:**

- 1. Weight of Debt ( $W_d$ ) = 60% or 0.60**
- 2. Weight of Preferred Stock ( $W_p$ ) = 10% or 0.10**

**3. Weight of Common Equity (We)  
= 30% or 0.30**

**4. Cost of Debt (Rd) = 7% or 0.07**

**5. Cost of Preferred Stock (Rp) =  
12% or 0.12**

**6. Cost of Common Equity (Re) =  
15% or 0.15**

**7. Tax Rate (t) = 25% or 0.25**

**Formula:**

**The formula for WACC is:**

$$\text{WACC} = (W_d * R_d * (1 - t)) + (W_p * R_p) + (W_e * R_e)$$

**Note: The cost of debt is adjusted for taxes because interest payments are tax-deductible.**

**Calculation:**

**Cost of Debt (after-tax) =  $R_d * (1 - t) = 0.07 * (1 - 0.25) = 0.07 * 0.75 = 0.0525$  or 5.25%**

**WACC =  $(0.60 * 0.0525) + (0.10 * 0.12) + (0.30 * 0.15)$**

**WACC =  $0.0315 + 0.0120 + 0.0450$**

**WACC = 0.0885**

**Final Answer:**

**The Weighted Average Cost of Capital (WACC) for Apex Corporation is 8.85%.**

|----|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | What's the most common mistake students make when calculating the Weighted Average Cost of Capital (WACC)?                 | A frequent error is incorrectly using the book value of debt instead of its market value. The WACC calculation should reflect current market conditions for both debt and equity.                                                                     |
| 2  | How can I effectively approach a capital budgeting question involving mutually exclusive projects?                         | Focus on comparing projects using methods like Net Present Value (NPV) or Internal Rate of Return (IRR). Choose the project that maximizes shareholder wealth, which typically means the one with the highest positive NPV.                           |
| 3  | What's the key difference between operating leases and finance leases, and why does it matter for corporate finance exams? | Finance leases transfer most of the risks and rewards of ownership to the lessee, appearing on the balance sheet. Operating leases are treated as off-balance sheet financing. Understanding this impacts financial statement analysis and valuation. |
| 4  | When faced with a dividend discount model question, what are the common assumptions I need to be aware of?                 | Key assumptions include constant dividend growth (Gordon Growth Model), stable dividend payout ratios, and that the required rate of return is greater than the growth rate. Deviations from these can lead to incorrect valuations.                  |

|   |                                                                                                                             |                                                                                                                                                                                                                                                     |
|---|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | How does the Modigliani-Miller theorem simplify corporate finance concepts, and what are its limitations in exam scenarios? | MM theory suggests that in perfect capital markets, a firm's value is independent of its capital structure. Limitations include its disregard for taxes, bankruptcy costs, and agency costs, which are crucial in real-world and exam applications. |
| 6 | What's the best way to explain the concept of residual income in an exam answer?                                            | Residual income is the income remaining after deducting the cost of capital. It represents the 'economic profit' a company generates. You can calculate it as: $\text{Net Income} - (\text{Equity Capital} * \text{Cost of Equity})$ .              |
| 7 | When analyzing a firm's working capital management, what are the key metrics I should focus on?                             | Key metrics include the Cash Conversion Cycle (CCC), Inventory Turnover, Accounts Receivable Turnover, and Accounts Payable Turnover. These reveal the efficiency of managing short-term assets and liabilities.                                    |
| 8 | What's the most practical advice for preparing for a corporate finance exam question on mergers and acquisitions (M&A)?     | Understand the valuation methodologies (e.g., DCF, comparable company analysis) and the factors driving synergy creation. Be prepared to discuss the impact of M&A on the acquirer's financial statements and shareholder value.                    |
