

How Do You Combine Like Terms In Math

Unveiling the Power of Combining Like Terms in Math

Ever feel like your math problems are a chaotic jumble of numbers and variables? Unleashing the power of combining like terms is like finding the secret code to simplifying those expressions, unlocking elegant solutions and revealing hidden patterns. This crucial mathematical skill, fundamental to algebra and beyond, empowers you to transform complex problems into manageable equations. From balancing your budget to understanding physics, this seemingly simple concept is a vital tool in the mathematical toolkit. Let's dive in and discover how to combine like terms effectively.

Understanding Like Terms: The Building Blocks of Simplification

Like terms are terms in an algebraic expression that have the same variables raised to the same powers. Imagine them as identical LEGO bricks – you can only combine bricks of the same type and size. For example, $3x$ and $7x$ are like terms because they both contain the variable 'x' raised to the power of 1. However, $3x$ and $3x^2$ are *not* like terms; although they share the same coefficient (3), the variable

'x' is raised to different powers. Similarly, $5y$ and $2z$ are not like terms because they have different variables. **Key Characteristics of Like Terms:**

- **Same Variables:** The variables (letters) must be identical.

- **Same Exponents:** The exponents of the variables must be identical.

Example: In the expression $2x + 5y + 3x - 2y$, $2x$ and $3x$ are like terms, and $5y$ and $-2y$ are like terms. Table 1: Identifying Like Terms

Expression	Like Terms
$4a + 2b + 3a - b$	$4a, 3a; 2b, -b$
$5x^2 + 2x + 7x^2 - x$	$5x^2, 7x^2; 2x, -x$
$8y + 3z + 2x$	None (all different terms)

Combining Like Terms: The Simplification Process

Combining like terms is the process of adding or subtracting the coefficients of those terms while keeping the variable and its exponent unchanged. It's essentially a shortcut for simplifying complex expressions. Procedure: 1. *Identify like terms:* Look for terms in the expression that have the same variable and exponent. 2.

Combine Coefficients: Add or subtract the numerical coefficients (the numbers in front of the variables) of the like terms. 3. **Keep the**

Variable and Exponent: Write down the resulting coefficient, followed by the same variable and exponent. **Example:** Simplify the expression $5x + 2y + 3x - y$. 1. Identify like terms: $5x$ and $3x$ are like terms, and $2y$ and $-y$ are like terms. 2. Combine Coefficients: $5 + 3 = 8$ and $2 + (-1) = 1$. 3. Keep the Variables and Exponents: The simplified expression is $8x + y$.

Real-World Applications of Combining Like

Cooking

• **Scenario:** A recipe calls for 2 cups of flour and 1 cup of sugar. You need to make 3 batches. • **Equation:** $2x + 1x = 3x$ • **Combined:** 6 cups flour + 3 cups sugar

Geometry

• **Scenario:** The perimeter of a rectangle is given by the formula $P = 2l + 2w$. If the length is 5 cm and the width is 3 cm, what is the perimeter? • **Equation:** $2 * 5 + 2 * 3$ • **Combined:** $10 + 6 = 16$ cm

The Benefits of Mastering Combining Like Terms

• **Problem Solving Efficiency:** It helps transform complex expressions into simpler ones, thus making problems more manageable and faster to solve. • **Mathematical Accuracy:** Correctly combining like terms guarantees accuracy in the end result, crucial for advanced mathematical concepts and applications. •

Understanding Relationships: Identifying and combining like terms

shows connections between different parts of an expression, which aids in understanding the underlying relationships.

Case Study: Simplifying a Physics Problem

A physics student is calculating the velocity of an object. The equation is: $v = 2t + 3t - t + 5$ By combining like terms ($2t + 3t - t$), the equation simplifies to: $v = 4t + 5$ This simplified equation makes it significantly easier to calculate the velocity for different values of time 't'.

Distributing and Combining Like Terms

The concept of combining like terms often works in tandem with the distributive property. This allows for the simplification of more complex algebraic expressions. • **Example:** $2(x + 3) + 5x$. Applying the distributive property first gives $2x + 6 + 5x$. Combining like terms results in $7x + 6$.

Solving Equations with Like Terms

Combining like terms is an essential step in solving equations. It streamlines the process by reducing the equation to a simpler form. • **Example:** Solve for 'x' in the equation $3x + 2 + x = 10$. Combine like terms to get $4x + 2 = 10$. Subtract 2 from both sides, resulting in $4x = 8$. Dividing by 4 gives $x = 2$.

Unlocking the Mystery: How to Combine Like Terms in Math

Ever stare at a math problem that looks like a jumbled alphabet soup mixed with numbers? You see things like $3x + 5y - 2x + 7$, and your

brain just does a little *nope*? Don't worry, you're not alone! This is a super common feeling when you first encounter what mathematicians call "combining like terms." But here's the good news: combining like terms is actually a fundamental and surprisingly straightforward skill in algebra. It's like sorting your socks – you put all the black socks together, all the blue ones together, and suddenly, your drawer is much more organized. In math, combining like terms helps simplify expressions, making them easier to understand, solve, and manipulate. So, let's dive deep into the wonderful world of combining like terms and transform that jumbled soup into a delicious, easy-to-digest algebraic broth!

What Exactly Are "Like Terms"?

Before we start combining, we need to understand what we're working with. In algebra, an expression is made up of terms. A term is a number, a variable, or a product of numbers and variables. For example, in the expression $3x + 5y - 2x + 7$, we have four terms: $3x$, $5y$, $-2x$, and 7 . Now, what makes terms "like"? * **The Variable Part:** Like terms must have the exact same variable part. This means they need to have the same variable(s) raised to the same power(s). * $5x$ and $-3x$ are like terms because they both have the variable x to the power of 1. * $2y^2$ and $7y^2$ are like terms because they both have the variable y to the power of 2. * $4ab$ and $9ab$ are like terms because they both have the variables a and b to the power of 1. * **The Constant Part:** The number part of a term (called the coefficient) can be different. That's the whole point of combining them! * **Constants are Like Terms Too:** Don't forget about numbers without any variables! These are called constant terms. All constant terms are considered like terms. So, 5 , -12 , and 200 can all be combined. Let's look at some examples to

solidify this: **Like Terms:** $7a$ and $2a$, $-3b^2$ and $10b^2$, $15xy$ and $-6xy$, 9 and -4 **Unlike Terms:** $3x$ and $3y$ (different variables), $2x$ and $2x^2$ (different powers of the same variable), $5ab$ and $5a$ (one has b , the other doesn't), 4 and $4x$ (one is a constant, the other has a variable) Understanding this distinction is the first crucial step to mastering how to combine like terms.

The "Why" Behind Combining Like Terms

Why do we even bother with this? Simplification is the name of the game! When you combine like terms, you're reducing the number of terms in an algebraic expression. This makes it: **Easier to read and understand:** A simplified expression is much less intimidating. **Easier to solve:** If you're solving an equation, a simpler form can make the process more manageable. **Easier to work with:** When you're dealing with more complex algebraic operations, having simplified expressions is a lifesaver. Think back to our sock analogy. Instead of a messy drawer with individual socks scattered everywhere, you have neat piles of black, blue, and grey. It's the same socks, just organized!

The "How": The Simple Rules of Combining Like Terms

The actual process of combining like terms is remarkably simple. You're essentially adding or subtracting the coefficients (the numbers in front of the variables) of the like terms. The variable part stays the same. Here's the golden rule: **Combine the coefficients, keep the variable.** Let's break it down with examples:

Combining Terms with Variables

Example 1: $3x + 5x$ We have two terms with the variable x . They are like terms. * Combine the coefficients: $3 + 5 = 8$. * Keep the variable: x . * So, $3x + 5x = 8x$.

Example 2: $7y - 2y$ Both terms have the variable y . They are like terms. * Combine the coefficients: $7 - 2 = 5$. * Keep the variable: y . * So, $7y - 2y = 5y$.

Example 3: $4a + 9a - a$ All terms have the variable a . They are like terms. Remember that $-a$ is the same as $-1a$. * Combine the coefficients: $4 + 9 - 1 = 12$. * Keep the variable: a . * So, $4a + 9a - a = 12a$.

Example 4: $-5b^2 + 3b^2$ Both terms have the variable b raised to the power of 2. They are like terms. * Combine the coefficients: $-5 + 3 = -2$. * Keep the variable part: b^2 . * So, $-5b^2 + 3b^2 = -2b^2$.

Combining Constant Terms

Example 5: $10 + 5$ These are both constant terms, so they are like terms. * Combine them: $10 + 5 = 15$.

Example 6: $12 - 7 + 3$ All are constant terms. * Combine them: $12 - 7 + 3 = 5 + 3 = 8$.

Combining Like Terms in More Complex Expressions

This is where it gets really useful! Often, you'll have expressions with multiple different types of terms. The key is to identify and group the like terms first.

Example 7: $3x + 5y - 2x + 7$

Step 1: Identify like terms. * Terms with x : $3x$ and $-2x$. * Terms with y : $5y$. (There's only one y term). * Constant terms: 7 . (There's only one constant term).

Step 2: Rearrange (optional but helpful). * Group the like terms together. * $(3x - 2x) + 5y + 7$

Step 3: Combine each group of like terms. * Combine the x

terms: $3x - 2x = (3 - 2)x = 1x = x$. * The y term remains $5y$. * The constant term remains 7 . * **Step 4: Write the simplified expression.** * $x + 5y + 7$ * **Example 8: $8a - 3b + 2a + 5b - 1$ ** * **Identify:** * a terms: $8a$ and $2a$. * b terms: $-3b$ and $5b$. * Constant term: -1 . * **Rearrange:** * $(8a + 2a) + (-3b + 5b) - 1$ * **Combine:** * $8a + 2a = 10a$. * $-3b + 5b = (-3 + 5)b = 2b$. * -1 remains -1 . * **Simplified expression:** * $10a + 2b - 1$ * **Example 9: $2x^2 + 4x - x^2 + 3x + 5$ ** * **Identify:** * x^2 terms: $2x^2$ and $-x^2$. * x terms: $4x$ and $3x$. * Constant term: 5 . * **Rearrange:** * $(2x^2 - x^2) + (4x + 3x) + 5$ * **Combine:** * $2x^2 - x^2 = (2 - 1)x^2 = 1x^2 = x^2$. * $4x + 3x = (4 + 3)x = 7x$. * 5 remains 5 . * **Simplified expression:** * $x^2 + 7x + 5$ Notice how in the last example, we have different "degrees" of the variable x (x^2 and x). These are not like terms, so they cannot be combined with each other.

Dealing with Negative Coefficients and Subtraction

One common stumbling block is when subtraction is involved, especially with negative numbers. Remember your rules for integer addition and subtraction! * **Example 10: $9p - 12p$ ** * $9 - 12 = -3$. * Result: $-3p$. * **Example 11: $-4m + 6m$ ** * $-4 + 6 = 2$. * Result: $2m$. * **Example 12: $5k - 8 - 2k + 3$ ** * k terms: $5k$ and $-2k$. * Constant terms: -8 and 3 . * Combine k terms: $5k - 2k = 3k$. * Combine constant terms: $-8 + 3 = -5$. * Result: $3k - 5$. * **Example 13: $x - 3 - 2x + 7$ ** * x terms: x (which is $1x$) and $-2x$. * Constant terms: -3 and 7 . * Combine x terms: $1x - 2x = -1x = -x$. * Combine constant terms: $-3 + 7 = 4$. * Result: $-x + 4$ or $4 - x$ (the order often doesn't matter for addition/subtraction, but

it's conventional to write the variable term first unless it's negative and you want to avoid leading negatives).

Putting It All Together: Practice Makes Perfect!

The best way to get comfortable with combining like terms is to practice. Here are some tips:

1. **Slow Down:** When you're starting, don't rush. Take your time to identify the like terms accurately.
2. **Use Different Colors:** If you're working on paper, try underlining or circling like terms with different colors. This visual cue can be incredibly helpful.
3. **Check Your Signs:** Pay extra attention to the plus and minus signs in front of each term. They are part of the term!
4. **Remember the "1":** Don't forget that a variable with no visible coefficient (like x or a^2) actually has a coefficient of 1 (or -1 if there's a minus sign).
5. **Master Integer Arithmetic:** If you're shaky on adding and subtracting positive and negative numbers, go back and review those concepts. They are fundamental to combining like terms.
6. **Break Down Complex Problems:** If an expression looks overwhelming, break it down into smaller steps. Identify, group, combine, and then write the simplified form.

Beyond the Basics: Why This Skill is Essential

Combining like terms is not just a standalone trick; it's a building block for so much more in mathematics. You'll use it when: *

Solving linear equations: Simplifying both sides of an equation by combining like terms is often the first step to isolating the variable. *

Factoring expressions: Understanding how terms relate is crucial

for factoring. * **Working with polynomials:** Polynomials are expressions with multiple terms, and combining like terms is how you simplify them. * **Graphing equations:** Simplified forms of equations can make graphing much easier. Essentially, any time you encounter an algebraic expression that isn't in its simplest form, you'll likely need to combine like terms to make it more manageable. So, there you have it! How to Combine Like Terms in Mathematics: A Comprehensive Guide

Combining like terms is a fundamental skill in algebra and beyond, serving as a cornerstone for simplifying expressions, solving equations, and understanding mathematical relationships. At its core, the process involves identifying terms that share the same variables raised to the same powers—essentially grouping those that “look the same”—and then merging their coefficients. This technique streamlines complex expressions and reveals clearer patterns, making it an essential tool for students and professionals alike.

Understanding what constitutes like terms is the first step toward mastery. In algebra, terms are considered like if they contain identical variable components with the same exponents. For example, in the expression $3x^2 + 5x - 2x^2 + 7$, the terms $3x^2$ and $-2x^2$ are like terms because both contain x raised to the second power. In contrast, x and x^2 are not like terms since their variable parts differ. Similarly, $4y$ and $-y$ are like terms, while $4y$ and $4z$ are not. Recognizing these relationships allows for accurate grouping and simplification. The process of combining like terms begins with careful inspection of each term in an expression. Start by isolating all terms containing the same

variables and exponents, then sum their coefficients. For instance, consider the expression $2a + 3b - 5a + 4b$. The terms $2a$ and $-5a$ are like terms—they both involve a single variable a to the first power—and can be combined as $(2 - 5)a$, resulting in $-3a$. Likewise, $3b$ and $4b$ are like terms, combining to $7b$. After grouping and summing, the expression simplifies to $-3a + 7b$, a more concise and useful form. This method extends beyond single-variable expressions. In multivariate polynomials, like terms might involve multiple variables as long as their structures match. For example, xy and $6xy$ are like terms, as are $3x^2y$ and $-5x^2y$, which combine to $-2x^2y$. However, xy and x^2y are not like terms—different variable powers—so they remain separate. Mastery of this principle enables efficient handling of higher-degree polynomials, rational expressions, and real-world modeling scenarios. Beyond simplification, combining like terms enhances clarity in equations and functions, directly impacting problem-solving accuracy. In algebra, it transforms unwieldy expressions into manageable forms, making it easier to isolate variables and solve for unknowns. This clarity is equally vital in calculus, where derivatives and integrals rely on simplified forms, and in applied fields like physics and engineering, where precise mathematical models depend on streamlined equations. From an educational perspective, consistent practice of combining like terms builds a strong foundation for advanced topics. Students who grasp this concept early find it easier to tackle quadratic equations, functions, and calculus. Moreover, as curriculum standards increasingly emphasize conceptual understanding over rote recall, recognizing and manipulating like terms fosters deeper mathematical reasoning. Looking ahead, the role of combining like terms remains indispensable in an evolving educational landscape. With the rise of adaptive learning platforms and AI-assisted tutoring, interactive exercises now allow learners to visualize term grouping and receive

instant feedback, reinforcing mastery. Additionally, as mathematics integrates more deeply into data science, coding, and machine learning, the ability to efficiently simplify and model expressions becomes ever more critical. In essence, combining like terms is more than a mechanical step—it is a gateway to mathematical fluency. By identifying shared structures and consolidating values, this practice transforms complexity into clarity, empowering learners and professionals to solve problems with precision and confidence. As mathematics continues to evolve, the ability to combine like terms remains a timeless skill, underpinning innovation and discovery across disciplines.

Unlocking Algebraic Power: A Comprehensive Guide on How to Combine Like Terms in Math

In the vast landscape of mathematics, few concepts are as foundational and universally applicable as combining like terms. Whether you're navigating basic arithmetic, tackling complex algebraic equations, or delving into advanced calculus, the ability to simplify expressions by combining like terms is an indispensable skill. It's the secret sauce that transforms messy, unwieldy equations into elegant, manageable forms, paving the way for clear understanding and accurate solutions. But what exactly does it mean to "combine like terms," and more importantly, **how do you combine like terms in math** effectively?

This in-depth guide will demystify the process, breaking it down into digestible steps, providing clear examples, and exploring its

significance across various mathematical contexts. We'll cover everything from the fundamental definition to practical applications, ensuring you not only understand the 'how' but also the 'why' behind this crucial algebraic manipulation.

What are "Like Terms"? The Building Blocks of Simplification

Before we can learn to combine them, we must first understand what constitutes "like terms." In algebra, terms are the individual parts of an expression separated by addition or subtraction signs. For example, in the expression $3x + 5 - 2y + 7x$, the terms are $3x$, 5 , $-2y$, and $7x$.

Like terms are terms that have the same variables raised to the same powers. The coefficients (the numerical part) can be different, but the variable part must be identical. Consider these examples:

1. **Variables Only:** $5x$ and $2x$ are like terms because they both have the variable x raised to the power of 1 (which is usually not written).
2. **Variables with Exponents:** $3y^2$ and $-7y^2$ are like terms because they both have the variable y raised to the power of 2.
3. **Multiple Variables:** $4ab$ and ab are like terms as they both contain the variables a and b , each raised to the power of 1.
4. **Constants:** Numbers without any variables are also considered like terms. For instance, 8 and -3 are like terms.

Conversely, terms are *not* like terms if:

1. They have different variables (e.g., $3x$ and $3y$).
2. They have the same variable but different exponents (e.g., $2x$

and $2x^2$).

3. One term has a variable and the other doesn't (e.g., $5x$ and 5).

Understanding this distinction is the critical first step in mastering the art of combining like terms. It's about identifying the identical algebraic DNA within different parts of an expression.

How Do You Combine Like Terms in Math? The Step-by-Step Process

Combining like terms is essentially a process of simplification. It involves adding or subtracting the coefficients of terms that share the same variable and exponent. Here's a clear, step-by-step approach:

Step 1: Identify the Like Terms

Scan your expression and group together all terms that have the exact same variable(s) raised to the exact same power(s). Don't forget to include the sign (positive or negative) that precedes each term.

Example: In the expression $7a + 3b - 2a + 5b + 10$, the like terms are:

1. $7a$ and $-2a$ (like terms with the variable a)
2. $3b$ and $5b$ (like terms with the variable b)
3. 10 (a constant term)

Step 2: Group the Like Terms (Optional but Recommended)

Rearrange the expression so that like terms are next to each other. This can be done mentally or by rewriting the expression. This visual grouping significantly reduces the chance of errors.

Example (continued): Rearranging the expression, we get: $7a - 2a + 3b + 5b + 10$.

Step 3: Combine the Coefficients of the Like Terms

For each group of like terms, perform the indicated addition or subtraction on their coefficients. The variable part remains the same.

1. **For the 'a' terms:** $7a - 2a$. The coefficients are 7 and -2 .
 $7 - 2 = 5$. So, $7a - 2a$ combines to $5a$.
2. **For the 'b' terms:** $3b + 5b$. The coefficients are 3 and 5 .
 $3 + 5 = 8$. So, $3b + 5b$ combines to $8b$.
3. **For the constant term:** 10 . There are no other constant terms to combine it with, so it remains 10 .

Step 4: Write the Simplified Expression

Combine the results from Step 3 to form the final simplified expression. Ensure all terms in the new expression are unlike terms.

Example (continued): Putting it all together, the simplified expression is $5a + 8b + 10$.

Illustrative Examples: Putting the Theory into Practice

Let's walk through a few more examples to solidify your understanding of **how to combine like terms in math**.

Example 1: Simple Linear Expression

Combine: $5x + 3y - 2x + 7y$

1. **Identify:** Like terms are $5x$ and $-2x$; $3y$ and $7y$.
2. **Group:** $(5x - 2x) + (3y + 7y)$
3. **Combine Coefficients:** $(5 - 2)x + (3 + 7)y$
4. **Simplify:** $3x + 10y$

Example 2: Expression with Exponents

Combine: $4m^2 + 6n - 2m^2 + 5n^2 - n + 3m^2$

1. **Identify:** Like terms are $4m^2$, $-2m^2$, and $3m^2$; $6n$ and $-n$; $5n^2$ (this term has no other like terms).
2. **Group:** $(4m^2 - 2m^2 + 3m^2) + (6n - n) + 5n^2$
3. **Combine Coefficients:** $(4 - 2 + 3)m^2 + (6 - 1)n + 5n^2$
4. **Simplify:** $5m^2 + 5n + 5n^2$

Note: It's conventional to write terms with higher exponents first, so you might also see this written as $5n^2 + 5m^2 + 5n$.

Example 3: Expression with Parentheses

Combine: $2(p + 3q) - (p - q) + 5q$

1. **Distribute:** First, remove the parentheses using the distributive property. Remember that a minus sign in front of parentheses changes the sign of each term inside. $2p + 6q - p + q + 5q$
2. **Identify:** Like terms are $2p$ and $-p$; $6q$, q , and $5q$.
3. **Group:** $(2p - p) + (6q + q + 5q)$
4. **Combine Coefficients:** $(2 - 1)p + (6 + 1 + 5)q$
5. **Simplify:** $1p + 12q$, which is usually written as $p + 12q$.

The Importance of Combining Like Terms in Algebra

The ability to combine like terms is far more than just an arithmetic exercise; it's a cornerstone of algebraic manipulation. Its significance is evident in several key areas:

Simplifying Algebraic Expressions

This is the most direct benefit. Complex expressions can be daunting. Combining like terms reduces them to their most basic, understandable form, making them easier to analyze and work with. This is essential for solving equations and inequalities.

Solving Equations

When you encounter an equation with multiple instances of the same variable, combining like terms is often the first step in isolating that variable. For example, in an equation like $3x + 5 + 2x = 15$, combining the x terms to $5x$ immediately simplifies the equation to $5x + 5 = 15$, making it much easier to solve for x .

Factoring Polynomials

While not a direct step, understanding how terms interact is crucial for factoring. Simplifying expressions before factoring can reveal common factors more readily.

Graphing Functions

In linear equations and other polynomial functions, the simplified form achieved by combining like terms often represents the standard form of the equation (e.g., $y = mx + b$), which is directly useful for graphing.

Understanding Polynomial Operations

When adding or subtracting polynomials, the process is fundamentally about identifying and combining like terms. For instance, adding $(2x^2 + 3x - 1)$ and $(x^2 - 5x + 4)$ involves combining $2x^2$ with x^2 , $3x$ with $-5x$, and -1 with 4 .

Common Pitfalls and How to Avoid Them

While the process of combining like terms is straightforward, students often make common mistakes. Being aware of these pitfalls can help you avoid them:

1. **Ignoring Signs:** The most frequent error is misplacing or ignoring the negative sign associated with a term. Always pay close attention to the sign immediately preceding a term. When grouping, include the sign.

2. **Combining Unlike Terms:** Mistaking terms with different variables or different exponents as like terms leads to incorrect simplifications. Double-check that the variable part (including exponents) is identical.
3. **Forgetting the Coefficient of 1:** When a variable appears by itself (e.g., x), its coefficient is 1 . Similarly, $-x$ has a coefficient of -1 . Ensure you account for these implicit coefficients.
4. **Errors in Distribution:** When dealing with expressions involving parentheses, ensure the distributive property is applied correctly, especially when a negative sign precedes the parenthesis.
5. **Arithmetic Mistakes:** Simple addition or subtraction errors can lead to the wrong final answer. Double-check your calculations with the coefficients.

To avoid these, take your time, use the grouping strategy, and consider using a different color pen or highlighter to visually mark like terms and their signs.

Beyond the Basics: Combining Like Terms with Fractional and Decimal Coefficients

The principles of combining like terms extend seamlessly to expressions with fractional or decimal coefficients. The process remains identical: identify like terms and combine their coefficients using the appropriate arithmetic operations for fractions or decimals.

Example with Fractions:

Combine: $\frac{1}{2}a + \frac{3}{4}b - \frac{3}{2}a + \frac{1}{4}b$

1. **Identify:** Like terms are $\frac{1}{2}a$ and $-\frac{3}{2}a$; $\frac{3}{4}b$ and $\frac{1}{4}b$.
2. **Group:** $(\frac{1}{2}a - \frac{3}{2}a) + (\frac{3}{4}b + \frac{1}{4}b)$
3. **Combine Coefficients:**
 1. For 'a': $\frac{1}{2} - \frac{3}{2} = \frac{1 - 3}{2} = \frac{-2}{2} = -1$. So, $-1a$ or $-a$.
 2. For 'b': $\frac{3}{4} + \frac{1}{4} = \frac{3 + 1}{4} = \frac{4}{4} = 1$. So, $1b$ or b .
4. **Simplify:** $-a + b$

Example with Decimals:

Combine: $2.5x - 1.3y + 4.2x - 0.7y$

1. **Identify:** Like terms are $2.5x$ and $4.2x$; $-1.3y$ and $-0.7y$.
2. **Group:** $(2.5x + 4.2x) + (-1.3y - 0.7y)$
3. **Combine Coefficients:**
 1. For 'x': $2.5 + 4.2 = 6.7$. So, $6.7x$.
 2. For 'y': $-1.3 - 0.7 = -2.0$. So, $-2.0y$ or $-2y$.
4. **Simplify:** $6.7x - 2y$

Conclusion: Mastering the Art of

Algebraic Simplification

Understanding **how to combine like terms in math** is a fundamental stepping stone in your mathematical journey. It's a skill that empowers you to simplify complex expressions, solve equations with greater ease, and build a robust foundation for more advanced algebraic concepts. Questions & Answers About how do you combine like terms in math

No	Question	Answer
1	What does it *actually* mean to 'combine like terms' in algebra?	Combining like terms means simplifying an expression by adding or subtracting terms that have the same variable raised to the same power. Think of it like grouping similar items together: you can add apples to apples, but you can't add apples to oranges.
2	How do I spot 'like terms' when I see them in an equation?	Look for terms that have the identical variable(s) and the exact same exponent(s) on those variables. For example, in ' $3x + 5y - 2x + y$ ', ' $3x$ ' and ' $-2x$ ' are like terms, and ' $5y$ ' and ' y ' (which is ' $1y$ ') are like terms.
3	What's the rule for combining terms with different signs (positive and negative)?	When combining like terms with different signs, you subtract the smaller absolute value from the larger absolute value and keep the sign of the term with the larger absolute value. For instance, combining ' $5x$ ' and ' $-2x$ ' results in ' $3x$ '.
4	Can I combine terms that have variables AND numbers attached?	Yes, as long as the variable part is identical! The numbers attached (coefficients) are what you combine. For example, in ' $4ab + 7b - 2ab$ ', you combine ' $4ab$ ' and ' $-2ab$ ' to get ' $2ab$ ', leaving ' $7b$ ' separate.

5	What happens if there are no like terms to combine in an expression?	If there are no terms with the same variables and exponents, the expression is already in its simplest form. You can't combine terms like '5x' and '3y' because they aren't 'like' each other.
6	Why is combining like terms so important in algebra?	Combining like terms is a fundamental step in simplifying algebraic expressions and equations. It makes them easier to understand, solve, and work with in more complex mathematical problems.
7	Are there any common mistakes to watch out for when combining like terms?	A big one is forgetting the signs! Always pay attention to whether a term is positive or negative. Also, be careful not to combine terms that only <i>*look*</i> similar but have different variable powers, like '2x' and '2x ² '.
