Neglecting maintenance can lead to costly repairs or even engine failure.

Steps for Bravo One Lower Unit Removal

Disclaimer: This guide is for informational purposes only. Always consult your owner's manual and seek professional help if unsure about any step. Incorrect procedures can cause damage to your engine. The process generally involves these steps: 1. *Preparation:* Disconnect the battery. Support the engine with suitable stands to prevent it from falling. Gather necessary tools, including sockets, wrenches, a drain pan, and potentially a torque wrench. 2. *Shift Lever Adjustment:* Place the shift lever in neutral and ensure it's firmly locked. This prevents accidental shifting during the removal process. 3. **Lower Unit Drain:** Carefully drain the lower unit lubricant into a suitable container. Note the quantity and condition of the oil; this can provide valuable insights into the health of the lower unit. 4.

Removing the Trim Tabs (if applicable): Some Bravo One models have trim tabs that need to be removed or adjusted before the lower unit can be detached. Consult your owner's manual for specific instructions. 5. *Uncoupling the Shift Cable:* Carefully disconnect the shift cable from the lower unit. This usually involves releasing a clamp or similar mechanism. Take pictures or make notes to ensure proper reassembly. 6. **Removing the Propeller:** Remove the propeller using the appropriate wrench. This step may require some force, but avoid damaging the propeller or the drive shaft. 7. Detaching the Lower Unit: Locate the lower unit retaining bolts. These are typically located around the upper portion of the lower unit where it connects

to the upper housing. Carefully remove these bolts. The lower unit might be slightly heavy, so ensure you have a firm grip and adequate support. 8. **Lower Unit Removal:** Slowly and carefully lower the lower unit. It may be helpful to have an assistant to help support the unit during this process. 9. **Inspection and Cleaning:** Once removed, inspect the lower unit for any signs of damage, corrosion, or leaks. Why Remove the Bravo One Lower Unit?

Common Scenarios

Before we dive into the "how-to," let's briefly touch on the common reasons why you might need to perform a Bravo One lower unit removal. Understanding these scenarios can help you better prepare and anticipate what you might encounter:

1. **Propeller Damage:** A damaged propeller, whether from hitting submerged objects or general wear and tear, is a primary reason. Replacing or repairing a bent or broken prop necessitates lower unit removal.
2. **Gearcase Leaks:** Water intrusion into the gearcase is a serious issue that can lead to costly damage. Identifying and fixing leaks, often involving replacing seals and gaskets, requires access to the internal components.
3. **Gear Wear or Failure:** Over time, gears can wear down or even fail. If you're experiencing grinding noises, difficulty shifting, or a complete loss of drive, gearcase inspection and repair might be necessary.
4. **Bearing Issues:** The bearings within the lower unit are crucial for smooth operation. Worn or damaged bearings can cause noise, vibration, and ultimately, failure.
5. **Shifting Mechanism Problems:** Issues with the shifting

mechanism, which connects the remote shifter to the gearcase, can also necessitate lower unit removal for inspection and repair.

6. **Corrosion and Deterioration:** Saltwater environments are notorious for causing corrosion. Regular inspections and proactive maintenance, which might involve lower unit removal, can prevent more significant problems down the line.
7. **Routine Maintenance and Inspections:** Even without specific issues, some boat owners prefer to remove and inspect their lower unit periodically, especially before extended storage or a demanding boating season. This allows for a thorough check of seals, gaskets, and internal components.

Essential Tools and Materials for Bravo One Lower Unit Removal

Having the right tools at your disposal is critical for a smooth and efficient Bravo One lower unit removal. Trying to force things with inadequate tools can lead to stripped bolts, damaged components, and frustration. Here's a list of what you'll likely need:

1. **Socket Set:** A comprehensive set of sockets, including deep well sockets, in both metric and standard sizes. Pay close attention to the specific bolt sizes commonly found on Bravo One units.
2. **Wrenches:** A selection of open-end and box-end wrenches.
3. **Torque Wrench:** Essential for reassembly to ensure bolts are tightened to the manufacturer's specifications.
4. **Pry Bars:** Sturdy pry bars can be helpful for gently separating components.
5. **Rubber Mallet:** For light persuasion when needed, avoid using excessive force.
6. **Fluid Drain Pan:** To catch the gear lube when draining.

7. **Gear Lube Pump and New Gear Lube:** You'll need to refill the gearcase after reassembly. Ensure you use the correct type and viscosity of gear lube recommended by Mercury Marine for your specific Bravo One model.
8. **Sealant and Gasket Material:** For reassembly, you may need specific sealants and gaskets.
9. **Scrapers and Wire Brushes:** To clean mating surfaces.
10. **Block of Wood or Support Stands:** To support the lower unit once it's detached.
11. **Marine Grade Grease:** For lubricating splines and O-rings.
12. **Gloves and Eye Protection:** Safety first!
13. **Service Manual:** While this guide is comprehensive, having the official Mercury Marine service manual for your specific Bravo One model is highly recommended. It will contain detailed diagrams and torque specifications.

Understanding the Bravo One Lower Unit Anatomy: Key Components

Before you start disconnecting anything, it's beneficial to have a basic understanding of the Bravo One lower unit's key components and how they relate to the removal process. This knowledge will help you identify potential sticking points and understand the function of each part you'll be interacting with.

1. **Gearcase:** This is the main housing that contains the gears, bearings, and drive shaft. It's the primary component you'll be removing.
2. **Drive Shaft:** This shaft transmits power from the engine's gimbal housing to the propeller. It has splines that connect to the driveshaft coupler within the upper unit.

3. **Prop Shaft:** This shaft extends from the gearcase and holds the propeller. It's also splined to connect to the forward or reverse gear.
4. **Water Pump Housing:** Located on the outside of the gearcase, this houses the impeller that circulates cooling water to the engine.
5. **Shift Shaft:** This shaft connects to the external shift lever and engages the forward, neutral, and reverse gears.
6. **U-Joints:** These flexible joints allow for the articulation of the driveshaft, accommodating engine movement and trim angles.
7. **Gimbal Housing:** This is the part of the stern drive that attaches to the transom of the boat and allows for steering and trim. The lower unit typically bolts to the bottom of the gimbal housing.
8. **Anodes (Zinc or Aluminum):** Sacrificial anodes designed to corrode instead of the boat's metal components, protecting against galvanic corrosion.

Step-by-Step Bravo One Lower Unit Removal Procedure

Now, let's get down to business. This procedure is outlined for a typical Bravo One installation. Always refer to your specific service manual for exact details and torque specifications.

Step 1: Prepare the Boat and Stern Drive

Safety and preparation are paramount. Ensure your boat is securely docked or on a trailer in a stable position. If on a trailer, make sure the trailer is properly supported. For Bravo One models with hydraulic steering, you might need to disconnect or secure the steering lines.

Consult your steering system manual if unsure.

Step 2: Drain the Gear Lube

Before you detach the lower unit, it's crucial to drain the gear lube.

This prevents a messy spill and ensures you have a clean start for refilling later. Locate the drain and fill plugs on the lower unit.

Typically, there's a drain plug at the very bottom of the gearcase and a fill plug higher up, often near the water intake. Place your drain pan beneath the drain plug, remove the plug, and allow all the old gear lube to drain out. Inspect the drained lube for any metal shavings or discolored fluid, which could indicate internal wear or damage.

Step 3: Shift into Neutral

This is a critical step for proper alignment during removal and reinstallation. Shift the stern drive into ****neutral****. You can usually do this by operating the remote shifter in the boat. Ensure the shift handle is truly centered. This aligns the internal shift mechanism for easier separation.

Step 4: Locate and Remove the Lower Unit Mounting Bolts

The Bravo One lower unit is typically secured to the upper unit (gimbal housing) by several large bolts. These bolts are usually accessed from underneath the cavitation plate and around the perimeter of the gearcase. You'll likely find bolts on the front and sides. Some may be countersunk or hidden behind trim pieces. Use the appropriate socket and extension to loosen and remove these bolts. Keep them organized, as they may differ in length or type.

Step 5: Disconnect Drive Shaft Splines

The drive shaft from the engine's upper unit is connected to the lower unit via splines. Once the mounting bolts are removed, you'll need to carefully separate the lower unit from the upper. This often requires a bit of gentle wiggling and sometimes a slight downward pull. Be patient; they can sometimes be a bit stubborn due to the splined connection. Avoid excessive force that could damage the splines on either the drive shaft or the lower unit.

Step 6: Support the Lower Unit

As you separate the lower unit, it will become free. Have your block of wood or support stands ready to catch the weight of the lower unit. It's surprisingly heavy, and you don't want it to fall and sustain damage. Ensure the support is stable and can hold the unit securely.

Step 7: Lower the Unit Away

Once the lower unit is free from the splines and supported, carefully lower it straight down and away from the upper unit. Take note of how it separates. You might need to maneuver it slightly to clear any obstructions. Keep an eye on the shift shaft to ensure it doesn't snag on anything during the descent.

Step 8: Inspect the Drive Shaft and Coupler

With the lower unit removed, you'll have access to the drive shaft and the driveshaft coupler in the upper unit. Inspect the splines on both for any signs of wear, damage, or corrosion. Clean them thoroughly and apply a thin layer of marine-grade grease before reassembly. This

is also a good time to check the condition of the U-joints in the driveshaft.

Step 9: Inspect the Shift Shaft

Examine the shift shaft where it protrudes from the upper unit and where it connects to the lower unit. Ensure it's not bent or damaged and that the splines are in good condition. Check the boot that seals the shift shaft for any tears or deterioration.

Step 10: Inspect the Water Pump

The water pump is typically located on the lower unit and is essential for engine cooling. You'll likely want to inspect and potentially replace the impeller and housing at this stage, especially if you're unsure of its last replacement date. This is a proactive maintenance step that can prevent overheating issues.

Reassembly Considerations

Reassembling the Bravo One lower unit follows a similar procedure in reverse, but with a few crucial points to emphasize:

1. **Alignment is Key:** Carefully align the drive shaft splines with the coupler and the shift shaft with its corresponding mechanism. This can be tricky and may require some gentle manipulation.
2. **Torque Specifications:** Use your torque wrench to tighten all mounting bolts to the manufacturer's specified torque values. Overtightening or undertightening can lead to serious problems.
3. **Proper Gasket Sealing:** Ensure all mating surfaces are clean and that any required gaskets or sealants are applied correctly

according to the service manual.

4. **Gear Lube:** Fill the gearcase with the correct type and amount of gear lube using a pump. Install the drain and fill plugs securely.
5. **Test Shifting:** Before running the engine, test the shifting mechanism manually to ensure it engages smoothly in all positions.
6. **Check for Leaks:** After running the engine briefly, visually inspect for any gear lube leaks around the mounting bolts and seals.

Troubleshooting Common Bravo One Lower Unit Removal Issues

Even with careful preparation, you might encounter some common hurdles:

1. **Stuck Bolts:** Corroded or seized mounting bolts can be a major headache. Apply penetrating oil and allow it to soak. Gentle tapping with a hammer might also help. In extreme cases, you might need to resort to drilling out bolts, but this should be a last resort.
2. **Lower Unit Won't Separate:** Ensure all bolts are removed. Sometimes, the splined connection can be very tight. Try wiggling the unit gently while applying slight downward pressure. Avoid using excessive force that could damage the splines.
3. **Difficulty Aligning for Reassembly:** This is often due to the drive shaft or shift shaft not being perfectly aligned. Try rotating the propeller slightly to help the splines mesh. Ensure the shift mechanism is correctly set in neutral.
4. **Water in Gear Lube:** If you find water in the old gear lube, it indicates a seal issue that needs to be addressed before reassembly.

When to Call a Professional

While this Bravo One lower unit removal manual provides extensive guidance, there are times when calling in a professional marine mechanic is the wisest course of action:

1. **Lack of Confidence:** If you're not comfortable with the process or feel unsure at any step, it's better to seek expert help.
2. **Stubborn Components:** If bolts are seized beyond your ability to remove them, or if the lower unit is extremely difficult to separate.
3. **Suspected Internal Damage:** If you find significant metal shavings in the old gear lube or suspect major internal gear or bearing damage.
4. **Specialized Tools Required:** Some Bravo One specific repairs or components might require specialized tools that you may not have.
5. **Lack of Time:** If you're on a tight schedule and can't afford potential delays that DIY repairs might entail.

Conclusion: Empowering Your Bravo One Maintenance

Removing and reinstalling a Bravo One lower unit can seem like a daunting task, but with the right knowledge, tools, and a methodical approach, it's certainly achievable. This comprehensive Bravo One lower unit removal manual has aimed to equip you with the essential steps and considerations. Remember to always prioritize safety, consult your specific service manual, and don't hesitate to seek professional help if needed. Regular maintenance and a proactive approach to your Bravo One's well-being will ensure many more seasons of enjoyable boating.

Bravo One Lower Unit Removal Manual: A Comprehensive Guide for Boat Owners

The Bravo One sterndrive is a popular and robust propulsion system found on a wide range of performance boats. Like any mechanical component, it requires regular maintenance and occasional repairs. One of the most common and crucial tasks for a boat owner or mechanic is the removal of the Bravo One lower unit. Whether you're preparing for a routine gear oil change, replacing worn-out impellers, addressing internal gear issues, or preparing for a major overhaul, understanding the proper procedure for Bravo One lower unit removal is paramount. This detailed, analytical guide will serve as your comprehensive manual, outlining the necessary steps, tools, and

considerations to ensure a safe and successful operation.

Why Remove the Bravo One Lower Unit?

Several scenarios necessitate the removal of the Bravo One lower unit. Understanding these reasons will help you anticipate when this procedure might be required:

1. **Impeller Replacement:** The raw water pump impeller is a critical wear item. Regular replacement is essential for proper engine cooling and preventing overheating. The impeller is located within the driveshaft housing of the lower unit.
2. **Gear Oil Change and Inspection:** While gear oil can be changed without removing the lower unit, a thorough inspection of the gear housing for leaks, water intrusion, or unusual wear patterns often requires its separation.
3. **Propeller Shaft Seal Replacement:** Leaks around the propeller shaft can lead to water ingress into the gear housing, contaminating the lubricant and causing significant damage.
4. **Gearcase Repairs:** Addressing issues such as chipped or broken gears, bearing failures, or worn clutch dogs necessitates the complete disassembly and repair of the lower unit, often starting with its removal.
5. **Corrosion and Damage Assessment:** For boats stored in saltwater environments, periodic inspection of the lower unit for galvanic corrosion or physical damage is vital. Removal allows for a more in-depth assessment.
6. **Winterization and Storage:** In colder climates, draining and flushing the lower unit is a critical step in winterization. While not always requiring full removal, it's a good opportunity for a quick inspection.

7. **Performance Upgrades:** Some performance upgrades or modifications might involve the replacement or rebuilding of the lower unit.

Essential Tools and Safety Precautions

Before embarking on Bravo One lower unit removal, ensure you have the correct tools and prioritize safety. Attempting this procedure with inadequate equipment or without taking proper precautions can lead to damage to the sterndrive, your boat, or even personal injury.

Specialized Tools for Bravo One Lower Unit Removal:

1. **Bravo One Gimbal Housing Alignment Tool:** Absolutely essential for reinstallation. This tool ensures the lower unit is correctly aligned with the gimbal housing, preventing drivetrain binding and premature wear.
2. **Bravo One Drive Shaft Holder/Wrench:** Used to hold the driveshaft stationary during the removal and installation of the upper and lower units.
3. **Bravo One Shift Cable Tool:** Facilitates the safe disconnection and reconnection of the shift cable.
4. **Gasket Scrapers:** For carefully removing old gasket material without damaging mating surfaces.
5. **Torque Wrenches (various sizes):** Crucial for tightening bolts to the manufacturer's specifications.
6. **Sockets and Wrenches (metric and standard):** A comprehensive set will be required.
7. **Pliers (various types):** For cotter pins, snap rings, and hoses.
8. **Drain Pans and Funnels:** For safely collecting drained gear oil and other fluids.

9. **Shop Rags and Cleaning Supplies:** For keeping the work area clean and for cleaning components.
10. **Engine Stand or Hoist (optional but recommended):** For supporting the engine and power tower during separation.
11. **Safety Glasses:** To protect your eyes from debris and fluids.
12. **Gloves:** To protect your hands from grease, oil, and potential cuts.
13. **Anti-seize Compound:** For lubricating bolt threads during reinstallation.

Safety First: Crucial Precautions

1. **Disconnect Battery:** Always disconnect the boat's battery before starting any work on the sterndrive to prevent accidental electrical discharge or starting.
2. **Support the Engine:** If you are separating the upper and lower gearcases, ensure the engine is adequately supported to prevent it from falling.
3. **Drain Fluids:** Properly drain all gear oil and any other fluids from the lower unit before removal. Dispose of these fluids responsibly.
4. **Work in a Well-Ventilated Area:** Many marine fluids and cleaners have strong fumes. Ensure adequate ventilation.
5. **Read the Service Manual:** This guide provides general instructions. Always consult the official Mercury Marine service manual specific to your Bravo One model year for precise torque values, procedures, and any model-specific nuances.
6. **Two-Person Job:** While some experienced mechanics can manage this alone, it is often safer and more efficient to have a second person assist, especially when maneuvering the heavy lower unit.

Step-by-Step Bravo One Lower Unit Removal

The process of removing the Bravo One lower unit can be broken down into several distinct phases. Each step requires careful attention to detail.

Phase 1: Preparation and Disconnection

This initial phase focuses on preparing the boat and disconnecting the essential systems that link the lower unit to the rest of the boat and engine.

1. Access the Engine Compartment:

Ensure you have clear access to the engine compartment where the sterndrive is attached to the gimbal housing and the power tower. This may involve tilting or raising the engine.

2. Shift into Neutral:

It is crucial to shift the transmission into neutral. This disengages the gears and makes the driveshaft easier to separate from the upper gearcase. Consult your owner's manual for the specific procedure to engage neutral if you're unsure.

3. Disconnect the Shift Cable:

Locate the shift cable where it enters the gimbal housing from the helm control. There is typically a retaining clip or a threaded fitting that secures the cable. Use the appropriate Bravo One shift cable tool or pliers to disconnect it. Take note of its orientation for reinstallation.

4. Disconnect Steering Linkage:

The steering system is connected to the sterndrive. You will need to disconnect the steering arm or tie rod from the sterndrive's steering mechanism. This usually involves removing a cotter pin and a castle nut or a bolted connection.

5. Disconnect Gimbal Bearing and Drive Shaft Housing Seals:

Inspect the area where the driveshaft housing meets the gimbal housing. There are often rubber boots and seals. Carefully inspect them for wear or damage. While not strictly a removal step, these are critical for reinstallation and maintaining a watertight seal.

6. Drain the Gear Oil:

Locate the drain and vent plugs on the lower unit. Place a suitable drain pan beneath the lower unit. Remove the drain plug (usually the lower one) and allow all the gear oil to drain completely. Once drained, reinstall the drain plug finger-tight. This step is vital to prevent spillage during removal.

Phase 2: Separating the Upper and Lower Units

This is the most mechanically involved part of the process, where the two main sections of the sterndrive are physically separated.

7. Locate and Loosen Gimbal Housing Bolts:

The Bravo One lower unit is attached to the gimbal housing by a series of bolts. These are typically located around the perimeter of the

gimbal housing where it meets the driveshaft housing. You will need a socket set to loosen and remove these bolts. Note the location of each bolt, as they may vary in length or type.

8. Identify and Loosen Power Tower Bolts (if applicable):

In some Bravo One configurations, the power tower (which houses the driveshaft and driveshaft bearing) might be bolted to the upper gearcase. If so, you'll need to loosen and remove these bolts as well. Again, pay close attention to bolt lengths and locations.

9. Secure the Driveshaft:

With the bolts loosened, you need to prevent the driveshaft from falling. Use the Bravo One driveshaft holder/wrench to engage the splines of the driveshaft and hold it securely. This tool will prevent the driveshaft from dropping when the lower unit is separated.

10. Carefully Separate the Lower Unit:

With the driveshaft held in place, and all fasteners loosened, you can now carefully begin to separate the lower unit. Gently rock the lower unit back and forth while pulling downwards. The driveshaft should slide out of the upper gearcase. Be prepared for the weight of the lower unit. Ensure you have a stable surface or a person ready to catch and support it. Do NOT let the driveshaft hang unsupported.

11. Remove the Lower Unit:

Once separated, carefully maneuver the Bravo One lower unit away from the transom and out of the boat. It is a heavy component, so proper lifting techniques or assistance are recommended.

Phase 3: Post-Removal Inspection and Next Steps

Once the lower unit is successfully removed, it's the ideal time for inspection and to prepare for the work you intend to perform.

12. Inspect Mating Surfaces:

Examine the mating surfaces of both the upper and lower gearcases. Look for any signs of gasket material damage, corrosion, or warping. Clean these surfaces thoroughly using a gasket scraper and appropriate marine solvent.

13. Inspect Driveshaft Splines:

Check the splines on the driveshaft and the corresponding splines in the upper gearcase for any signs of wear, damage, or galling. Clean and lightly lubricate them with marine grease before reinstallation.

14. Inspect Gimbal Bearing and U-Joints:

While the lower unit is off, it's a prime opportunity to inspect the gimbal bearing and U-joints located within the gimbal housing. Check for smooth rotation, excessive play, or signs of corrosion and wear. These are critical components for the drivetrain's longevity.

15. Prepare for Work:

Place the lower unit on a stable workbench or stand. Now you can proceed with your intended maintenance or repair tasks, such as impeller replacement, gear oil change, seal replacement, or internal gearcase repairs.

Reinstallation: The Reverse Procedure

Reinstalling the Bravo One lower unit is essentially the reverse of the removal process. However, it's crucial to pay extra attention to alignment and torque specifications.

1. **Align Driveshaft:** Carefully align the driveshaft splines with the upper gearcase and slide the lower unit into place. The gimbal housing alignment tool is critical here.
2. **Install Bolts:** Reinstall all gimbal housing and power tower bolts, tightening them in a star pattern to ensure even pressure.
3. **Torque Specifications:** Use your torque wrench to tighten all fasteners to the manufacturer's specified torque values.
4. **Reconnect Steering:** Reconnect the steering linkage securely.
5. **Reconnect Shift Cable:** Reconnect the shift cable, ensuring it's properly seated and secured.
6. **Fill with Gear Oil:** Fill the lower unit with the correct type and amount of marine gear oil, as specified in your service manual.
7. **Test Operation:** After reinstallation, start the engine and test the shifting mechanism in neutral, forward, and reverse. Check for any unusual noises or vibrations.

Troubleshooting Common Issues

During Bravo One lower unit removal, you might encounter a few common issues:

1. **Stuck Lower Unit:** If the lower unit seems stuck, do not force it. Check that all bolts have been removed and that the driveshaft is properly aligned. Sometimes, a gentle tap with a rubber mallet on the casing can help break it loose. Ensure the driveshaft holder is still engaged.

2. **Water Intrusion:** If you discover water in the gear oil, it indicates a seal failure. The gimbal housing seals, drive shaft housing seals, or propeller shaft seals are prime suspects and will likely need replacement.
3. **Corrosion:** Significant corrosion on the mating surfaces can make separation difficult. Carefully clean the affected areas. Severe corrosion may require professional attention.

Conclusion

Questions & Answers About bravo one lower unit removal manual

N o	Question	Answer
1	What's the first crucial step before attempting to remove a Bravo One lower unit?	The absolute first step is to ensure the boat is securely supported on a trailer or stands, and the drain plug is removed to completely drain all the gear lube. This prevents mess and makes removal easier.
2	Do I need any special tools to remove a Bravo One lower unit?	Yes, you'll likely need a torque wrench, a socket set with extensions, a pry bar or spreader tool, and potentially a specialized tool to disconnect the shift cable linkage, depending on the specific model year.
3	How do I disconnect the shift cable from the Bravo One lower unit?	Locate the shift cable at the rear of the drive. You'll need to identify the type of connection (clip, bolt, or pin) and carefully release it. Refer to your manual for the exact procedure for your drive's year.
