We'll break down the fundamentals, walk through practical examples, and even provide you with a handy worksheet to solidify your understanding. **Let's dive in!**

Understanding pH and pOH: The Basics

In simple terms, **pH** measures the **acidity** of a solution, while **pOH** measures its **alkalinity** or **basicity**. The scale for both ranges from 0 to 14, with: • $pH < 7$: Acidic (e.g., lemon juice) • $pH = 7$: Neutral (e.g., pure water) • $pH > 7$: Basic/Alkaline (e.g., bleach) But how exactly are these values calculated? Let's delve deeper: **1. The Role of Hydrogen and Hydroxide Ions** The key to understanding pH and pOH lies in the concentration of hydrogen ions (H^+) and hydroxide ions (OH^-) in a solution. • **pH**: It's calculated based on the *concentration of hydrogen ions (H^+)* in a solution. The higher the concentration of H^+ , the lower the pH and the more acidic the solution. • **pOH**: Similarly, it's based on the *concentration of hydroxide ions (OH^-)*. The higher the concentration of OH^- , the lower the pOH and the more basic the solution. **2. The Magic of the pH and pOH Equations** Here are the fundamental equations we'll be using: • $pH = -\log[H^+]$ • $pOH = -\log[OH^-]$ [H^+] and [OH^-] represent the concentrations of hydrogen and hydroxide ions, respectively, expressed in moles per liter (M). **3. The Interplay of pH and pOH** There's a crucial relationship between pH and pOH: $pH + pOH = 14$ This equation holds true for all solutions at 25°C. It means that if you know the pH, you can easily calculate the pOH, and vice versa.

Practical Examples: Mastering the Calculations

Now, let's put theory into practice with some examples. **Example 1: Calculating pH from Hydrogen Ion Concentration**

Example 2: Calculating pOH from Hydroxide Ion Concentration **Problem:** A solution has a hydroxide ion concentration of 1×10^{-10} M. What is its pOH? **Solution:** 1. **Use the equation:** $pOH = -\log[OH^-]$ 2. **Plug in the concentration:** $pOH = -\log(1 \times 10^{-10})$ 3. **Solve:** $pOH = 10$ **Therefore, the pOH of the solution is 10.** **Example 3: Calculating pH from pOH** **Problem:** A solution has a pOH of 9. What is its pH? **Solution:** 1. **Use the equation:** $pH + pOH = 14$ 2. **Rearrange the equation to solve for pH:** $pH = 14 - pOH$ 3. **Plug in the pOH value:** $pH = 14 - 9$ 4. **Solve:** $pH = 5$ **Therefore, the pH of the solution is 5.**

Understanding the Fundamentals: pH and pOH Explained

Before we jump into the nitty-gritty of calculations, let's ensure we're all on the same page about what pH and pOH actually represent. These values are all about the concentration of ions in an aqueous solution.

What is pH?

pH stands for "potential of hydrogen" and is a measure of the acidity or alkalinity of a solution. It's directly related to the concentration of hydrogen ions (H^+) or, more accurately, hydronium ions (H_3O^+) in water. Pure water has a neutral pH of 7 at 25°C. Solutions with a pH less than 7 are acidic, meaning they have a higher concentration of H^+ ions. Solutions with a pH greater than 7 are alkaline (or basic), indicating a lower concentration of H^+ ions (and a higher concentration of hydroxide ions, OH^-).

What is pOH?

Similarly, pOH stands for "potential of hydroxide" and measures the concentration of hydroxide ions (OH^-) in a solution. A lower pOH indicates a higher concentration of OH^- ions, making the solution more alkaline. Pure water also has a neutral pOH of 7. While pH focuses on acidity, pOH focuses on alkalinity. They are intrinsically linked, as we'll see in the calculations.

The Relationship Between pH and pOH

The magic happens with the ion product constant of water (K_w). At 25°C, the value of K_w is 1.0×10^{-14} . This constant represents the equilibrium between hydrogen ions and hydroxide ions in water:

This equilibrium leads to a crucial relationship: the sum of pH and pOH in any aqueous solution at 25°C is always 14.

$$\text{pH} + \text{pOH} = 14$$

This simple equation is a cornerstone of all pH and pOH calculations. If you know one, you can instantly find the other. This relationship is frequently tested on **chemistry pH and pOH calculations worksheets**, so make sure it's etched into your memory!

The Mathematical Definitions

To perform calculations, we need the mathematical definitions:

1. **pH = $-\log[\text{H}^+]$** : The pH is the negative logarithm of the hydrogen ion concentration (in moles per liter, or Molarity).
2. **pOH = $-\log[\text{OH}^-]$** : The pOH is the negative logarithm of the hydroxide ion concentration (in Molarity).

Remember, the logarithm function compresses a wide range of concentrations into a more manageable scale (0-14). The negative sign means that as the ion concentration increases, the pH/pOH value decreases.

Essential Formulas for pH and pOH Calculations

Now that we've got the foundational concepts, let's arm ourselves with the formulas we'll need to tackle those calculation problems. A good **chemistry pH and pOH calculations worksheet** will often involve applying these formulas in various scenarios.

Calculating pH from $[\text{H}^+]$

This is the most direct calculation. If you're given the molar concentration of hydrogen ions, plug it into the pH formula:

$$\text{pH} = -\log[\text{H}^+]$$

Example: If $[\text{H}^+] = 1.0 \times 10^{-3} \text{ M}$, then $\text{pH} = -\log(1.0 \times 10^{-3}) = 3$.

Calculating $[H^+]$ from pH

Sometimes, you'll be given the pH and need to find the hydrogen ion concentration. To do this, you'll use the inverse of the logarithm function, which is the antilogarithm (or 10 raised to the power of the number):

$$[H^+] = 10^{-\text{pH}}$$

Example: If pH = 4.5, then $[H^+] = 10^{-4.5} \text{ M} \approx 3.16 \times 10^{-5} \text{ M}$.

Calculating pOH from $[OH^-]$

This is analogous to the pH calculation, but for hydroxide ions:

$$\text{pOH} = -\log[OH^-]$$

Example: If $[OH^-] = 1.0 \times 10^{-5} \text{ M}$, then $\text{pOH} = -\log(1.0 \times 10^{-5}) = 5$.

Calculating $[OH^-]$ from pOH

And the inverse for finding hydroxide concentration:

$$[OH^-] = 10^{-\text{pOH}}$$

Example: If pOH = 9.2, then $[OH^-] = 10^{-9.2} \text{ M} \approx 6.31 \times 10^{-10} \text{ M}$.

Using the pH + pOH = 14 Relationship

As we discussed, this is your go-to for converting between pH and pOH. This is incredibly useful when a problem gives you information about one but asks for a calculation involving the other.

1. To find pOH from pH: **pOH = 14 - pH**
2. To find pH from pOH: **pH = 14 - pOH**

Example: If pH = 2.5, then $\text{pOH} = 14 - 2.5 = 11.5$.

Common Scenarios on pH and pOH Worksheets

A well-designed **chemistry pH and pOH calculations worksheet** will present a variety of problems that test your understanding of these formulas and concepts. Let's explore some common scenarios you're likely to encounter.

Scenario 1: Given $[H^+]$, find pH and pOH.

This is often the starting point. You'll be given the molarity of H^+ ions and asked to calculate both pH and pOH.

Example Problem: A solution has a hydrogen ion concentration of 0.001 M . Calculate its pH and pOH.

Solution Steps:

1. Calculate pH: $\text{pH} = -\log(0.001) = 3$
2. Calculate pOH: $\text{pOH} = 14 - \text{pH} = 14 - 3 = 11$

Scenario 2: Given $[OH^-]$, find pOH, pH, and $[H^+]$.

Similar to the above, but starting with hydroxide ions.

Example Problem: The hydroxide ion concentration in a solution is $2.5 \times 10^{-4} \text{ M}$. Determine its pOH, pH, and hydrogen ion concentration.

Solution Steps:

1. Calculate pOH: $\text{pOH} = -\log(2.5 \times 10^{-4}) \approx 3.60$
2. Calculate pH: $\text{pH} = 14 - \text{pOH} = 14 - 3.60 = 10.40$
3. Calculate $[\text{H}^+]$: $[\text{H}^+] = 10^{-\text{pH}} = 10^{-10.40} \text{ M} \approx 3.98 \times 10^{-11} \text{ M}$

Scenario 3: Given pH, find $[\text{H}^+]$ and pOH.

This tests your ability to use the antilogarithm function.

Example Problem: A solution has a pH of 8.75. Find its pOH and hydrogen ion concentration.

Solution Steps:

1. Calculate pOH: $\text{pOH} = 14 - \text{pH} = 14 - 8.75 = 5.25$
2. Calculate $[\text{H}^+]$: $[\text{H}^+] = 10^{-\text{pH}} = 10^{-8.75} \text{ M} \approx 1.78 \times 10^{-9} \text{ M}$

Scenario 4: Given pOH, find $[\text{OH}^-]$ and pH.

The reverse of the previous scenario.

Example Problem: A solution has a pOH of 2.1. What is its pH and hydroxide ion concentration?

Solution Steps:

1. Calculate pH: $\text{pH} = 14 - \text{pOH} = 14 - 2.1 = 11.9$
2. Calculate $[\text{OH}^-]$: $[\text{OH}^-] = 10^{-\text{pOH}} = 10^{-2.1} \text{ M} \approx 7.94 \times 10^{-3} \text{ M}$

Scenario 5: Dealing with Strong Acids and Bases

Often, worksheets will involve solutions of strong acids or bases. The key here is that strong acids and bases dissociate completely in water. This means that the concentration of the acid/base is equal to the concentration of the H^+ (for strong acids) or OH^- (for strong bases) ions they produce.

Example Problem: Calculate the pH of a 0.05 M solution of hydrochloric acid (HCl).

Solution Steps:

1. Recognize that HCl is a strong acid and dissociates completely: $\text{HCl} \rightarrow \text{H}^+ + \text{Cl}^-$
2. Therefore, $[\text{H}^+] = [\text{HCl}] = 0.05 \text{ M}$
3. Calculate pH: $\text{pH} = -\log(0.05) \approx 1.30$

Example Problem: Calculate the pOH of a 0.002 M solution of sodium hydroxide (NaOH).

Solution Steps:

1. Recognize that NaOH is a strong base and dissociates completely: $\text{NaOH} \rightarrow \text{Na}^+ + \text{OH}^-$
2. Therefore, $[\text{OH}^-] = [\text{NaOH}] = 0.002 \text{ M}$
3. Calculate pOH: $\text{pOH} = -\log(0.002) \approx 2.70$

Scenario 6: Calculations Involving Dilutions

Sometimes, you might need to calculate the pH or pOH of a solution after it has been diluted. Remember the dilution formula: $M_1V_1 = M_2V_2$, where M is molarity and V is volume. You'll need to calculate the new concentration after dilution and then proceed with your pH/pOH calculations.

Example Problem: What is the pH of a solution created by diluting 50 mL of a 0.1 M HCl solution to a final volume of 500 mL?

Solution Steps:

1. Calculate the new concentration of HCl: $M_1 = 0.1 \text{ M}$, $V_1 = 50 \text{ mL}$, $V_2 = 500 \text{ mL}$.
 $M_2 = (M_1V_1) / V_2 = (0.1 \text{ M} \times 50 \text{ mL}) / 500 \text{ mL} = 0.01 \text{ M HCl}$.

2. Since HCl is a strong acid, $[H^+] = 0.01\text{ M}$.

3. Calculate pH: $pH = -\log(0.01) = 2$.

Mastering pH and pOH Calculations: Your Essential Guide to the Chemistry Worksheet

The intricate world of chemistry often presents students with a variety of concepts, and among the most fundamental and frequently encountered are pH and pOH. Understanding these scales, which quantify the acidity and basicity of aqueous solutions, is crucial for success in countless chemical disciplines, from environmental science to biochemistry. While the theoretical underpinnings are vital, the practical application often comes in the form of detailed worksheets. This article serves as a comprehensive, analytical guide to **chemistry pH and pOH calculations worksheets**, equipping you with the knowledge and strategies to tackle them with confidence. We'll delve into the core principles, common problem types, and effective approaches to mastering these essential calculations.

The Foundation: Understanding pH and pOH Scales

Before diving into calculations, a firm grasp of the underlying definitions is paramount. Both pH and pOH are logarithmic scales used to express the concentration of hydrogen ions (H^+) and hydroxide ions (OH^-) in a solution, respectively. These ions are intrinsically linked by the autoionization of water, a reversible process where water molecules act as both an acid and a base, forming H^+ and OH^- .

The key equilibrium constant for this process is the ion-product constant of water, K_w . At 25°C, K_w has a value of 1.0×10^{-14} . This constant is central to all pH and pOH relationships:

$$K_w = [H^+][OH^-] = 1.0 \times 10^{-14} \text{ (at 25°C)}$$

This equation highlights a crucial inverse relationship: as the concentration of H^+ ions increases (making the solution more acidic), the concentration of OH^- ions must decrease, and vice versa. This interplay is what defines acidic, neutral, and basic solutions.

Defining pH and pOH: The Mathematical Framework

The logarithmic nature of the pH and pOH scales simplifies the handling of very small concentration values. They are defined as follows:

- pH:** The negative logarithm (base 10) of the hydrogen ion concentration. $pH = -\log_{10}[H^+]$
- pOH:** The negative logarithm (base 10) of the hydroxide ion concentration. $pOH = -\log_{10}[OH^-]$

These definitions lead to another fundamental relationship that is frequently tested on **pH and pOH calculation worksheets**:

$$\text{pH} + \text{pOH} = 14 \text{ (at } 25^{\circ}\text{C)}$$

This equation is incredibly powerful. If you can determine either the pH or the pOH of a solution, you can easily calculate the other. This interdependency is a cornerstone of most worksheet problems.

Interpreting the Scales: Acidity, Neutrality, and Basicity

The pH scale ranges from 0 to 14, providing a simple way to classify solutions:

1. **pH < 7:** Acidic solution (higher concentration of H^+ ions)
2. **pH = 7:** Neutral solution ($[\text{H}^+] = [\text{OH}^-]$)
3. **pH > 7:** Basic or alkaline solution (higher concentration of OH^- ions)

Similarly, the pOH scale is interpreted in the opposite manner:

1. **pOH < 7:** Basic solution (higher concentration of OH^- ions)
2. **pOH = 7:** Neutral solution
3. **pOH > 7:** Acidic solution (higher concentration of H^+ ions)

Understanding these interpretations is crucial for problem-solving, as worksheets often require you to identify the nature of a solution based on calculated values.

Common Problems Found on pH and pOH Calculation Worksheets

Chemistry pH and pOH calculations worksheets typically cover a range of problem types, testing your ability to apply the fundamental equations in various scenarios. Mastering these common formats will significantly improve your performance.

Calculating pH and pOH from Ion Concentrations

This is the most straightforward type of problem. You will be given either the molar concentration of H^+ or OH^- ions and asked to calculate the corresponding pH or pOH, and then the other value.

Example: If the $[\text{H}^+]$ of a solution is 2.5×10^{-4} M, calculate the pH and pOH.

Solution Steps:

1. Calculate pH: $\text{pH} = -\log(2.5 \times 10^{-4}) = 3.60$
2. Calculate pOH: $\text{pOH} = 14 - \text{pH} = 14 - 3.60 = 10.40$

Example: If the $[\text{OH}^-]$ of a solution is 1.8×10^{-9} M, calculate the pOH and pH.

Solution Steps:

1. Calculate pOH: $\text{pOH} = -\log(1.8 \times 10^{-9}) = 8.74$
2. Calculate pH: $\text{pH} = 14 - \text{pOH} = 14 - 8.74 = 5.26$

Calculating Ion Concentrations from pH and pOH

These problems are the inverse of the previous type. You'll be given a pH or pOH value and asked to determine the molar concentration of H^+ or OH^- ions.

To reverse the logarithmic function, we use the antilogarithm, which is raising 10 to the power of the value:

1. $[H^+] = 10^{-pH}$
2. $[OH^-] = 10^{-pOH}$

Example: A solution has a pH of 8.25. Calculate the $[H^+]$ and $[OH^-]$.

Solution Steps:

1. Calculate $[H^+]$: $[H^+] = 10^{-8.25} = 5.6 \times 10^{-9} \text{ M}$
2. Calculate pOH: $pOH = 14 - 8.25 = 5.75$
3. Calculate $[OH^-]$: $[OH^-] = 10^{-5.75} = 1.8 \times 10^{-6} \text{ M}$ (or use K_w)

Example: A solution has a pOH of 3.10. Calculate the $[OH^-]$ and $[H^+]$.

Solution Steps:

1. Calculate $[OH^-]$: $[OH^-] = 10^{-3.10} = 7.9 \times 10^{-4} \text{ M}$
2. Calculate pH: $pH = 14 - 3.10 = 10.90$
3. Calculate $[H^+]$: $[H^+] = 10^{-10.90} = 1.3 \times 10^{-11} \text{ M}$ (or use K_w)

Strong Acids and Strong Bases Calculations

Worksheets often include problems involving strong acids and strong bases. The key here is that strong acids and bases dissociate completely in water. Therefore:

1. For a strong monoprotic acid (e.g., HCl, HNO_3 , H_2SO_4 in its first dissociation), the molar concentration of the acid is equal to the molar concentration of H^+ ions. $[H^+] = \text{Molarity of strong acid}$
2. For a strong base containing hydroxide ions (e.g., NaOH, KOH), the molar concentration of the base is equal to the molar concentration of OH^- ions. $[OH^-] = \text{Molarity of strong base}$

Example: Calculate the pH of a 0.050 M solution of hydrochloric acid (HCl).

Solution Steps:

1. Recognize HCl as a strong monoprotic acid, so $[H^+] = 0.050 \text{ M}$.
2. Calculate pH: $pH = -\log(0.050) = 1.30$

Example: Calculate the pOH of a 0.010 M solution of sodium hydroxide (NaOH).

Solution Steps:

1. Recognize NaOH as a strong base, so $[OH^-] = 0.010 \text{ M}$.
2. Calculate pOH: $pOH = -\log(0.010) = 2.00$
3. (Optional) Calculate pH: $pH = 14 - 2.00 = 12.00$

Important Note on Polyprotic Acids: For polyprotic acids like sulfuric acid (H_2SO_4), the first dissociation is strong, but subsequent dissociations are weaker. Worksheets typically simplify this for introductory problems by treating the first dissociation as the primary source of H^+ , or by explicitly stating to consider only the first dissociation.

Calculations Involving Dilution

Dilution problems introduce the concept of changing concentrations. The key principle is that the moles of solute remain constant before and after dilution. The dilution equation is:

$$M_1V_1 = M_2V_2$$

Where:

1. M_1 = initial molarity

2. V_1 = initial volume
3. M_2 = final molarity
4. V_2 = final volume

Example: If 50 mL of a 0.20 M HCl solution is diluted to a final volume of 250 mL, what is the pH of the diluted solution?

Solution Steps:

1. Use the dilution equation to find the new concentration of HCl (and thus $[H^+]$): $(0.20 \text{ M})(50 \text{ mL}) = M_2(250 \text{ mL})$
 $M_2 = \frac{(0.20 \text{ M})(50 \text{ mL})}{250 \text{ mL}} = 0.040 \text{ M}$
2. Calculate the pH of the diluted solution: $pH = -\log(0.040) = 1.40$

Weak Acids and Weak Bases (Introduction)

While often a more advanced topic, some introductory **pH and pOH calculation worksheets** may include basic problems on weak acids and bases. These involve equilibrium constants (K_a for acids, K_b for bases) and often require using an ICE (Initial, Change, Equilibrium) table. The key difference is that weak acids and bases do not dissociate completely, meaning $[H^+]$ or $[OH^-]$ will be less than the initial concentration of the weak acid/base.

For a weak acid HA: $HA \rightleftharpoons H^+ + A^-$

For a weak base BOH: $BOH \rightleftharpoons B^+ + OH^-$

These problems are more complex and require a deeper understanding of equilibrium principles. When encountered, ensure you identify the correct equilibrium constant and set up your ICE table properly.

Strategies for Success on pH and pOH Worksheets

Conquering **chemistry pH and pOH calculations worksheets** involves more than just memorizing formulas. A strategic approach will ensure accuracy and efficiency.

1. Understand the Concepts First

Before you even look at a problem, ensure you understand the definitions of pH, pOH, $[H^+]$, $[OH^-]$, K_w , and the relationship between them. Grasping the meaning of acidity and basicity is fundamental.

2. Identify the Type of Problem

As soon as you read a problem, categorize it. Is it about calculating from concentration? Calculating concentration from pH? Is it a strong acid/base? Is it a dilution? This categorization will dictate the formulas and steps you need to use.

3. Write Down Knowns and Unknowns

Clearly list what information is given in the problem (e.g., pH, concentration, volume) and what you are asked to find. This organized approach helps prevent errors.

4. Use the Correct Formulas

Have your essential formulas readily available:

1. $pH = -\log[H^+]$
2. $pOH = -\log[OH^-]$
3. $[H^+] = 10^{-pH}$
4. $[OH^-] = 10^{-pOH}$

5. $\text{pH} + \text{pOH} = 14$
6. $[\text{H}^+][\text{OH}^-] = 1.0 \times 10^{-14}$
7. $M_1V_1 = M_2V_2$ (for dilutions)

5. Pay Attention to Significant Figures

This is a common pitfall. When calculating pH or pOH from a concentration, the number of decimal places in the pH/pOH value should equal the number of significant figures in the concentration. When calculating concentration from pH/pOH, the number of significant figures in the concentration should match the number of decimal places in the pH/pOH.

6. Show Your Work Clearly

Even if you can do a calculation in your head, write down each step. This not only helps your instructor grade your work but also allows you to track your thought process and identify errors if you get the wrong answer. This is invaluable for **learning pH calculations**.

7. Double-Check Your Answers

Does your answer make sense? If you have a strong acid, the pH should be low (significantly less than 7). If you have a strong base, the pH should be high (significantly greater than 7). If you dilute a solution, its concentration should decrease, and its pH should move closer to 7 (if it was acidic, pH increases; if it was basic, pH decreases).

8. Practice, Practice, Practice!

The more **chemistry pH and pOH calculation problems** you work through, the more comfortable and proficient you will become. Utilize extra practice sheets, online resources, and textbook exercises.

Conclusion

Chemistry pH and pOH calculations worksheets are designed to solidify your understanding of these fundamental chemical concepts. By mastering the definitions, understanding the relationships between pH, pOH, $[\text{H}^+]$, and $[\text{OH}^-]$, and applying systematic strategies to solve various problem types, you can navigate these worksheets with confidence. Remember that practice is key to developing fluency in these essential calculations, setting you up for success in your chemistry studies and beyond. Whether you're dealing with strong acids, bases, or dilutions, the principles remain consistent, and with diligent application, you'll find yourself adept at manipulating these crucial scales.

Questions & Answers About chemistry ph and poh calculations worksheet

No	Question	Answer
1	What's the fundamental difference between pH and pOH, and how are they related?	pH measures the concentration of hydrogen ions (H ⁺) in a solution, while pOH measures the concentration of hydroxide ions (OH ⁻). They are inversely related: in aqueous solutions at 25°C, pH + pOH = 14. So, a high pH means a low pOH, and vice versa.
2	I'm stuck on a calculation: given a pH of 3.5, how do I find the H ⁺ concentration?	The formula to convert pH to H ⁺ concentration is $[H^+] = 10^{(-pH)}$. For a pH of 3.5, the $[H^+]$ concentration would be $10^{(-3.5)}$ M, which is approximately 3.16×10^{-4} M.
3	How do I calculate pH if I'm given the pOH? For example, if pOH is 8.2?	Using the relationship pH + pOH = 14, you can find the pH. If pOH = 8.2, then pH = 14 - 8.2 = 5.8. This indicates an acidic solution.
4	What's the significance of a pH of 7, and what does it tell us about [H ⁺] and [OH ⁻] concentrations?	A pH of 7 indicates a neutral solution. In a neutral solution at 25°C, the concentration of hydrogen ions ($[H^+]$) is equal to the concentration of hydroxide ions ($[OH^-]$), both being 1×10^{-7} M.
5	I have a worksheet problem that gives me the molarity of a strong acid, like 0.01 M HCl. How do I calculate its pH?	For strong acids, the molarity of the acid directly equals the molarity of H ⁺ ions. So, if you have 0.01 M HCl, $[H^+] = 0.01$ M. Then, pH = $-\log(0.01) = 2$.
6	What's the practical application of pH and pOH calculations in a chemistry lab?	These calculations are crucial for understanding and controlling the acidity or basicity of solutions. They are used in titrations, buffer preparation, environmental monitoring, and many chemical synthesis processes to ensure reactions proceed as intended and to maintain safety.
7	My worksheet asks for the pOH of a strong base solution with a given OH ⁻ concentration. What's the formula I need?	The formula for pOH is $pOH = -\log[OH^-]$. If you're given the hydroxide ion concentration, simply plug it into this formula. For instance, if $[OH^-] = 0.005$ M, then $pOH = -\log(0.005) = 2.3$.
