Integration by parts is a technique used to evaluate definite and indefinite integrals. It stems from the product rule for differentiation. The fundamental formula is: $\int u \, dv = uv - \int v \, du$

Where:

- $\int$ represents the integration operation
- u and v are functions of x
- du and dv are the respective differentials of u and v

This seemingly simple formula holds a surprising amount of power. By carefully selecting u and dv , often guided by strategic choices, practitioners can transform seemingly intractable integrals into more manageable ones.

Mastering Integration by Parts: Your Comprehensive Worksheet with Answers

Ever stared at an integral and thought, "There has to be a better way than brute force?" If that thought has crossed your mind, you're in luck! Today, we're diving deep into a powerful integration technique that can untangle many seemingly complex integrals: **integration by parts**. And to solidify your understanding, we've got a comprehensive **integration by parts worksheet with answers** designed to put your newfound knowledge to the test.

Integration by parts is like a secret weapon in the calculus arsenal. It's derived from the product rule of differentiation, and it allows us to transform an integral that's difficult to solve into one that's hopefully simpler. This technique is a cornerstone for many calculus students and professionals alike, proving invaluable in fields ranging from physics and engineering to economics and computer science.

What is Integration by Parts, Anyway?

At its core, integration by parts is based on the product rule of differentiation:

If u and v are functions of x , then:

$$\frac{d}{dx}(uv) = u\frac{dv}{dx} + v\frac{du}{dx}$$

Now, let's integrate both sides with respect to x :

$$\int \frac{d}{dx}(uv) dx = \int (u\frac{dv}{dx} + v\frac{du}{dx}) dx$$

$$\int uv' dx = \int u dv + \int v du$$

Rearranging this equation, we get the fundamental formula for integration by parts:

$$\int u dv = uv - \int v du$$

The trick, of course, is choosing the right functions for u and dv . This is where strategic thinking comes into play. The goal is to select u such that its derivative (du) is simpler than u , and to select dv such that it can be easily integrated to find v .

Choosing the Right u and dv : The LIATE Rule

Many students struggle with deciding which part of the integrand should be u and which should be dv . A helpful mnemonic device is the **LIATE rule**:

1. Logarithmic functions (e.g., $\ln(x)$, $\log_2(x)$)
2. Inverse trigonometric functions (e.g., $\arctan(x)$, $\arcsin(x)$)
3. Algebraic functions (e.g., x^2 , $3x$, $\sqrt{x}$)
4. Trigonometric functions (e.g., $\sin(x)$, $\cos(x)$, $\tan(x)$)
5. Exponential functions (e.g., e^x , 2^x)

The LIATE rule suggests that you should choose u to be the function that appears first in this list. The remaining part of the integrand will be

dv . This strategy often leads to a simpler integral in the $\int v \, du$ term.

Let's Get Our Hands Dirty: Integration by Parts Worksheet

Now that we've reviewed the theory, it's time to practice! This **integration by parts worksheet with answers** is designed to help you build confidence and proficiency. We'll cover a range of examples, from straightforward applications to those requiring a bit more thought.

Section 1: Basic Integration by Parts

For each integral below, identify u and dv , compute du and v , and then apply the integration by parts formula.

1. $\int x \cos(x) \, dx$
2. $\int x e^x \, dx$
3. $\int \ln(x) \, dx$
4. $\int x \sin(2x) \, dx$
5. $\int x^2 \ln(x) \, dx$

Answers and Explanations for Section 1

1. **Integral:** $\int x \cos(x) \, dx$

Choosing u and dv : Based on LIATE, $u=x$ (algebraic) and $dv=\cos(x) \, dx$ (trigonometric).

Calculations: $du = dx$, $v = \int \cos(x) \, dx = \sin(x)$.

Applying the formula: $\int u \, dv = uv - \int v \, du$

$$\int x \cos(x) \, dx = x \sin(x) - \int \sin(x) \, dx$$

$$= x \sin(x) - (-\cos(x)) + C$$

$$= x \sin(x) + \cos(x) + C$$

2. **Integral:** $\int x e^x dx$

Choosing u and dv : $u=x$ (algebraic) and $dv=e^x dx$ (exponential).

Calculations: $du = dx$, $v = \int e^x dx = e^x$.

Applying the formula:

$$\int x e^x dx = x e^x - \int e^x dx$$

$$= x e^x - e^x + C$$

$$= e^x(x-1) + C$$

3. **Integral:** $\int \ln(x) dx$

Choosing u and dv : This one is a bit tricky as it looks like there's only one function. We can write it as $\int \ln(x) \cdot 1 dx$. So, $u=\ln(x)$ (logarithmic) and $dv=1 dx$.

Calculations: $du = \frac{1}{x} dx$, $v = \int 1 dx = x$.

Applying the formula:

$$\int \ln(x) dx = \ln(x) \cdot x - \int x \cdot \frac{1}{x} dx$$

$$= x \ln(x) - \int 1 dx$$

$$= x \ln(x) - x + C$$

4. **Integral:** $\int x \sin(2x) dx$

Choosing u and dv : $u=x$ (algebraic) and $dv=\sin(2x) dx$ (trigonometric).

Calculations: $du = dx$, $v = \int \sin(2x) dx$. To find v , we use a simple substitution: let $w = 2x$, so $dw = 2 dx$, $dx = \frac{1}{2} dw$. Then $\int \sin(w) \frac{1}{2} dw = \frac{1}{2} (-\cos(w)) = -\frac{1}{2} \cos(2x)$. So, $v = -\frac{1}{2} \cos(2x)$.

Applying the formula:

$$\int x \sin(2x) dx = x (-\frac{1}{2} \cos(2x)) - \int (-\frac{1}{2} \cos(2x)) dx$$

$$= -\frac{1}{2} x \cos(2x) + \frac{1}{2} \int \cos(2x) dx$$

Now, we need to integrate $\cos(2x)$. Similar to finding v , $\int \cos(2x) dx = \frac{1}{2} \sin(2x)$.

$$= -\frac{1}{2} x \cos(2x) + \frac{1}{2} \left(\frac{1}{2} \sin(2x) \right) + C$$

$$= -\frac{1}{2} x \cos(2x) + \frac{1}{4} \sin(2x) + C$$

5. **Integral:** $\int x^2 \ln(x) \, dx$

Choosing u and dv : $u = \ln(x)$ (logarithmic) and $dv = x^2 \, dx$ (algebraic).

Calculations: $du = \frac{1}{x} \, dx$, $v = \int x^2 \, dx = \frac{x^3}{3}$.

Applying the formula:

$$\int x^2 \ln(x) \, dx = \ln(x) \cdot \frac{x^3}{3} - \int \frac{x^3}{3} \cdot \frac{1}{x} \, dx$$

$$= \frac{x^3}{3} \ln(x) - \int \frac{x^2}{3} \, dx$$

$$= \frac{x^3}{3} \ln(x) - \frac{1}{3} \int x^2 \, dx$$

$$= \frac{x^3}{3} \ln(x) - \frac{1}{3} \left(\frac{x^3}{3} \right) + C$$

$$= \frac{x^3}{3} \ln(x) - \frac{x^3}{9} + C$$

$$= \frac{x^3}{3} (3 \ln(x) - 1) + C$$

Section 2: Repeated Integration by Parts

Sometimes, applying integration by parts once isn't enough. You might need to apply it again to the resulting integral. These problems are excellent for building resilience and understanding how the technique can be iterative.

6. $\int x^2 e^x \, dx$

7. $\int e^x \sin(x) \, dx$ (This one is special!)

Answers and Explanations for Section 2

6. **Integral:** $\int x^2 e^x \, dx$

First application of integration by parts:

Let $u = x^2$ (algebraic) and $dv = e^x \, dx$ (exponential).

Then $du = 2x \, dx$ and $v = e^x$.

$$\int x^2 e^x \, dx = x^2 e^x - \int 2x e^x \, dx$$

$$= x^2 e^x - 2 \int x e^x dx$$

Second application of integration by parts (for $\int x e^x dx$):

We already solved $\int x e^x dx$ in problem 2, which is $x e^x - e^x$.

Substituting back:

$$\int x^2 e^x dx = x^2 e^x - 2 (x e^x - e^x) + C$$

$$= x^2 e^x - 2x e^x + 2e^x + C$$

$$= e^x (x^2 - 2x + 2) + C$$

7. Integral: $\int e^x \sin(x) dx$

This integral is a classic example where integration by parts is applied twice, and then you solve for the integral itself!

First application:

Let $u = \sin(x)$ (trigonometric) and $dv = e^x dx$ (exponential).

Then $du = \cos(x) dx$ and $v = e^x$.

$$\int e^x \sin(x) dx = e^x \sin(x) - \int e^x \cos(x) dx$$

Second application (for $\int e^x \cos(x) dx$):

Now, let $u = \cos(x)$ and $dv = e^x dx$.

Then $du = -\sin(x) dx$ and $v = e^x$.

$$\int e^x \cos(x) dx = e^x \cos(x) - \int e^x (-\sin(x)) dx$$

$$= e^x \cos(x) + \int e^x \sin(x) dx$$

Substitute back into the first equation:

Let $I = \int e^x \sin(x) dx$.

$$I = e^x \sin(x) - (e^x \cos(x) + I)$$

$$I = e^x \sin(x) - e^x \cos(x) - I$$

Now, solve for I :

$$2I = e^x \sin(x) - e^x \cos(x)$$

$$I = \frac{1}{2} (e^x \sin(x) - e^x \cos(x)) + C$$

$$I = \frac{e^x}{2} (\sin(x) - \cos(x)) + C$$

When Integration by Parts Might Not Be Enough

While integration by parts is incredibly powerful, it's not a universal solution for all integrals. Some integrals, like those involving complex rational functions or certain trigonometric substitutions, might require different techniques such as partial fraction decomposition or trigonometric substitution. Always assess your integral and consider the best approach.

1. **Practice, Practice, Practice:** The more you use the formula, the more intuitive it becomes.
2. **Be Organized:** Clearly label your u , dv , du , and v to avoid confusion.
3. **Don't Forget the Constant of Integration:** Remember to add "+ C" at the end of your indefinite integrals.
4. **Check Your Work:** Differentiate your final answer to see if you get back the original integrand. This is a crucial step to catch any errors.
5. **Consider the LIATE Rule:** It's a fantastic guideline for choosing u .
6. **Recognize Patterns:** Certain types of integrals (like $x^n e^x$ or $x^n \ln(x)$) will become familiar, and you'll be able to apply integration by parts more rapidly.

Understanding Integration by Parts: A Comprehensive Worksheet Guide
Integration by parts stands as a cornerstone technique in calculus, enabling students and practitioners alike to tackle complex integrals that resist simpler methods. Rooted in the product rule of differentiation, this strategy transforms challenging integrals involving the product of two functions into more manageable forms. A well-structured integration by parts worksheet with answers serves not only as a learning tool but also as a practical resource to build confidence and mastery in applying this method systematically.

The Foundation: The Integration by Parts Formula
At its core, integration by parts is derived from the product rule, which states that the derivative of the product of two functions u and v is $u'v + uv'$. When integrating, reversing this process yields the

integral form: $\int u \, dv = uv - \int v \, du$. This shift from differentiation to integration allows for strategic selection of u and dv , simplifying the original integral. A thorough worksheet guides learners through identifying suitable u and dv pairs, emphasizing the LIATE rule—Logarithmic, Inverse trigonometric, Algebraic, Trigonometric, Exponential—as a practical heuristic for choosing u . This foundational understanding is reinforced through repeated practice, making the transition from theory to application seamless.

How a Structured Worksheet Enhances Mastery An effective integration by parts worksheet is thoughtfully designed to build competence step by step. It begins with basic problems that isolate u and dv , gradually advancing to layered functions and nested

applications. Each exercise is paired with clear, annotated solutions, revealing not just the final answer but the reasoning behind each substitution and simplification. This transparency helps students internalize the method rather than memorize steps. Moreover, the inclusion of diverse problems—ranging from polynomials multiplied by exponentials to trigonometric products—ensures broad exposure. The worksheet format encourages active learning: solving, checking, and reflecting on errors fosters deeper comprehension and long-term retention.

Beyond mere computation, integration by parts cultivates analytical thinking. It trains learners to deconstruct complex expressions, anticipate algebraic manipulations, and recognize patterns—skills vital across mathematics, physics, and engineering. For instance, integrals arising in area

calculations, work done by variable forces, or probability density functions all rely on this technique. By consistently applying integration by parts through guided practice, students develop a robust toolkit for solving real-world problems where integration is essential.

Practical Applications and Real-World Impact

The utility of integration by parts extends far beyond academic exercises. In physics, it aids in computing center-of-mass moments, electric field integrals, and energy distributions. In signal processing, it supports Fourier transform calculations and time-domain analysis. In probability and statistics, it helps derive moments and expectations involving products of random variables. A solid worksheet contextualizes these applications, showing how breaking down a

product leads to simpler integrals that can be evaluated using known antiderivatives. This connection between theory and application transforms abstract mathematics into a powerful problem-solving instrument.

By engaging regularly with integration by parts worksheets, learners grow not only in technical skill but also in confidence and creativity. They begin to see integrals not as insurmountable barriers but as puzzles to be solved step by step. As technology advances, computational tools may assist in verification, but the conceptual grasp gained through deliberate practice remains irreplaceable.

The Future of Integration by Parts Education
Looking ahead, the role of integration by parts in STEM education is poised to evolve alongside adaptive learning technologies. Interactive digital worksheets with instant

feedback, AI-driven problem generators, and personalized learning paths promise to make mastery more accessible and efficient. Yet, the human element—guided by structured worksheets that emphasize understanding over rote computation—will remain vital. Educators and learners alike benefit from a balanced approach: leveraging technology while grounding progress in clear, methodical practice. As integration by parts continues to underpin analytical problem-solving, its place in foundational curricula is secure, supported by resources that empower every student to become a confident and capable integrator.

Mastering Integration by Parts: A Comprehensive Guide with Worksheets and Answers

For students grappling with the complexities of calculus, integration by parts stands as a

pivotal technique, often presenting a formidable challenge. This powerful method, derived from the product rule of differentiation, allows us to integrate products of functions that would otherwise be intractable. Understanding and mastering integration by parts is not just about solving textbook problems; it's about unlocking a deeper comprehension of calculus and its applications in fields like physics, engineering, economics, and probability.

This article aims to demystify integration by parts, providing a detailed explanation, practical tips, and, crucially, a selection of [integration by parts worksheet](#) problems with comprehensive solutions. We'll explore the underlying theory, common pitfalls, and strategies for selecting the right parts for your integration. Whether you're a high school student preparing for advanced placement exams, a university student

navigating introductory calculus courses, or an educator seeking valuable teaching resources, this guide is designed to be your go-to resource.

The Essence of Integration by Parts

At its core, integration by parts is the inverse of the product rule for differentiation. Recall the product rule: if $u(x)$ and $v(x)$ are differentiable functions, then the derivative of their product is:

$$\frac{d}{dx}[u(x)v(x)] = u(x)v'(x) + u'(x)v(x)$$

Now, let's integrate both sides with respect to x :

$$\int \frac{d}{dx}[u(x)v(x)] dx = \int [u(x)v'(x) + u'(x)v(x)] dx$$

The left side simplifies to $u(x)v(x)$ by the fundamental theorem of calculus. The right side can be split into two integrals:

$$\int u(x)v'(x) dx = \int u(x)v'(x) dx + \int u'(x)v(x) dx$$

Rearranging this equation to solve for one of the integrals, we arrive at the integration by parts formula:

$$\boxed{\int u dv = uv - \int v du}$$

This formula is the cornerstone of the technique. It transforms a potentially difficult integral of a product, $\int u dv$, into a new integral, $\int v du$, which we hope is simpler to solve. The key to successful integration by parts lies in strategically choosing which part of the integrand will be u and which part will be dv .

Choosing 'u' and 'dv': The LIATE Rule

The success of integration by parts hinges on making the right choices for u and dv . A common mnemonic device to aid in this decision is the acronym LIATE (or sometimes ILATE or DETAIL), which stands for the order

of preference for choosing u :

1. L: Logarithmic functions (e.g., $\ln x$, $\log_2 x$)
2. I: Inverse trigonometric functions (e.g., $\arctan x$, $\arcsin x$)
3. A: Algebraic functions (e.g., x^2 , $3x+1$, $\sqrt{x}$)
4. T: Trigonometric functions (e.g., $\sin x$, $\cos x$, $\tan x$)
5. E: Exponential functions (e.g., e^x , 2^x , 10^x)

The general principle is to choose u as the function that comes first in this list, and dv as the rest of the integrand. The reasoning behind LIATE is that functions higher on the list generally become simpler when differentiated (e.g., $\ln x$ differentiates to $1/x$, x^2 differentiates to $2x$, while trigonometric and exponential functions often repeat their form or cycle). Conversely,

functions lower on the list are typically easier to integrate.

Let's consider an example: $\int x \sin x \, dx$. According to LIATE, A (algebraic) comes before T (trigonometric). So, we choose:

1. $u = x$
2. $dv = \sin x \, dx$

Then, we differentiate u to find du and integrate dv to find v :

1. $du = dx$
2. $v = \int \sin x \, dx = -\cos x$

Applying the integration by parts formula:

$$\int x \sin x \, dx = x(-\cos x) - \int (-\cos x) \, dx$$

$$= -x \cos x + \int \cos x \, dx$$

$$= -x \cos x + \sin x + C$$

When LIATE Isn't Enough: Further Considerations

While LIATE is a powerful heuristic, it's not a foolproof rule. There are instances where a different choice might be more beneficial.

Sometimes, you might need to apply integration by parts multiple times. Other times, a clever rearrangement or a different choice of u and dv can simplify the problem significantly.

For instance, in integrals of the form $\int e^x \cos x \, dx$ or $\int e^x \sin x \, dx$, both e^x and $\cos x$ (or $\sin x$) appear in both the L and E categories. In such cases, the LIATE order offers no clear preference. However, it's common to choose u as the exponential function and dv as the trigonometric function (or vice versa). The key is that applying integration by parts will lead to an equation where the original integral

appears on both sides, allowing you to solve for it algebraically. This is known as "tabular integration" or "cyclical integration by parts."

Common Pitfalls and How to Avoid Them

Students often encounter difficulties when first learning integration by parts. Here are some common pitfalls and strategies to overcome them:

1. Incorrect Choice of 'u' and 'dv':

As discussed, this is the most frequent mistake. If the new integral $\int v \, du$ is more complex than the original, or if it's impossible to solve, reconsider your choices. Always check if differentiating your chosen u simplifies the expression and if integrating dv is straightforward.

2. Forgetting the '+ C':

Remember that integration by parts is an indefinite integration technique. Always add the constant of integration, $+ C$, to your final answer. If you forget it in intermediate steps, make sure it's there at the end.

3. Algebraic Errors:

The formula involves subtraction and the integration of the resulting term. Be meticulous with signs and algebraic manipulations. Double-checking each step is crucial.

4. Repeated Application Errors:

When integration by parts needs to be applied more than once, the complexity can increase. Keep track of the signs and the terms clearly. For complex cases, consider using tabular integration, which systematically organizes the process.

5. Forgetting to Integrate 'v du':

The formula requires you to integrate the product $v \, du$. Make sure you actually perform this integration and don't just substitute the expressions for v and du . The goal is to simplify, not just rearrange.

The Power of Tabular Integration

For integrals requiring multiple applications of integration by parts, such as $\int x^2 e^x \, dx$, the tabular method (also known as the DI method) provides a more organized approach. It's particularly useful when you have a function that differentiates to zero after several steps (like a polynomial) and a function that is easy to integrate repeatedly (like an exponential or trigonometric function).

The method involves creating a table with two columns: 'D' (for differentiation) and 'I' (for

integration). You repeatedly differentiate the function chosen for the 'D' column until you reach zero, and repeatedly integrate the function chosen for the 'I' column the same number of times.

Example: $\int x^2 e^x \, dx$

Choose $u = x^2$ (differentiates to zero) and $dv = e^x \, dx$ (easy to integrate).

D (Derivative)	I (Integral)	Sign
x^2	e^x	+
$2x$	e^x	-
2	e^x	+
0	e^x	-

The solution is obtained by multiplying the terms diagonally, applying the alternating signs:

$$\int x^2 e^x \, dx = (x^2)(e^x) - (2x)(e^x) + (2)(e^x) + C$$

$$= x^2 e^x - 2x e^x + 2e^x + C$$

$$= e^x (x^2 - 2x + 2) + C$$

This tabular method greatly reduces the chance of sign errors and organizational mistakes when dealing with multiple integrations.

Using $\int u \, dv = uv - \int v \, du$: $\int \ln x \, dx = (\ln x)(x) - \int x \left(\frac{1}{x}\right) \, dx = x \ln x - \int 1 \, dx = x \ln x - x + C$

4. Problem: $\int x^3 \ln x \, dx$

Solution: Let $u = \ln x$ (L) and $dv = x^3 \, dx$ (A). Then $du = \frac{1}{x} \, dx$ and $v = \int x^3 \, dx = \frac{x^4}{4}$. Using $\int u \, dv = uv - \int v \, du$: $\int x^3 \ln x \, dx = (\ln x) \left(\frac{x^4}{4}\right) - \int \frac{x^4}{4} \left(\frac{1}{x}\right) \, dx = \frac{x^4}{4} \ln x - \int \frac{x^3}{4} \, dx = \frac{x^4}{4} \ln x - \frac{1}{4} \int x^3 \, dx = \frac{x^4}{4} \ln x - \frac{1}{4} \left(\frac{x^4}{4}\right) + C = \frac{x^4}{4} \ln x - \frac{x^4}{16} + C$

$$\ln x - 1) + C$$

5. Problem: $\int e^{2x} \sin x \, dx$

Solution: This requires applying integration by parts twice and solving for the integral.

Let $I = \int e^{2x} \sin x \, dx$. Choose $u = \sin x$ (T) and $dv = e^{2x}$ (E). Then $du = \cos x \, dx$ and $v = \int e^{2x} \, dx = \frac{1}{2} e^{2x}$. $I = (\sin x)$

$$\left(\frac{1}{2} e^{2x} \right) - \int \frac{1}{2} e^{2x} (\cos x \, dx) \quad I = \frac{1}{2} e^{2x} \sin x - \frac{1}{2} \int e^{2x} \cos x \, dx$$

Now, let's evaluate $\int e^{2x} \cos x \, dx$ using integration by parts. Choose $u' =$

$$\cos x \text{ (T) and } dv' = e^{2x} \, dx \text{ (E). Then } du' = -\sin x \, dx \text{ and } v' = \frac{1}{2} e^{2x}.$$

$$\int e^{2x} \cos x \, dx = (\cos x) \left(\frac{1}{2} e^{2x} \right) - \int \frac{1}{2} e^{2x} (-\sin x \, dx) = \frac{1}{2} e^{2x} \cos x + \frac{1}{2} \int e^{2x} \sin x \, dx = \frac{1}{2} e^{2x} \cos x + \frac{1}{2} I$$

Substitute this back into the equation for

$$\begin{aligned}
 I &= \frac{1}{2} e^{2x} \sin x - \frac{1}{2} \left(\frac{1}{2} e^{2x} \cos x + \frac{1}{2} \right) \\
 I &= \frac{1}{2} e^{2x} \sin x - \frac{1}{4} e^{2x} \cos x - \frac{1}{4} I
 \end{aligned}$$

Now, solve for I :

$$\begin{aligned}
 I + \frac{1}{4} I &= \frac{1}{2} e^{2x} \sin x - \frac{1}{4} e^{2x} \cos x \\
 \frac{5}{4} I &= \frac{1}{4} e^{2x} (2 \sin x - \cos x) \\
 I &= \frac{4}{5} \left(\frac{1}{4} e^{2x} (2 \sin x - \cos x) \right) + C \\
 I &= \frac{1}{5} e^{2x} (2 \sin x - \cos x) + C
 \end{aligned}$$

6. Problem: $\int \arctan x \, dx$

Solution: Similar to $\ln x$, we treat $\arctan x$ as a product with 1. Let $u = \arctan x$ (I) and $dv = 1$, $dx = dx$ (A). Then $du = \frac{1}{1+x^2} \, dx$ and $v = \int dx = x$.

Using $\int u \, dv = uv - \int v \, du$:

$$\int \arctan x \, dx = (\arctan x)(x) - \int x \left(\frac{1}{1+x^2} \right) \, dx$$

$= x \arctan x - \int \frac{x}{1+x^2} \, dx$

To solve $\int \frac{x}{1+x^2} \, dx$, use a substitution: let $w = 1+x^2$, so $dw = 2x \, dx$, or $x \, dx = \frac{1}{2} dw$

$\frac{1}{2} dw$. $\int \frac{x}{1+x^2} \, dx = \int \frac{1}{w} \left(\frac{1}{2} dw \right) = \frac{1}{2} \int \frac{1}{w} \, dw = \frac{1}{2} \ln|w| = \frac{1}{2} \ln(1+x^2)$ (since $1+x^2$ is always positive). So, $\int \arctan x \, dx = x \arctan x - \frac{1}{2} \ln(1+x^2) + C$.

7. Problem: $\int x^2 \sin x \, dx$

Solution: This requires two applications of integration by parts. We can use the tabular method.

$D: x^2 \rightarrow \frac{d}{dx} x^2 = 2x \rightarrow \frac{d}{dx} 2x = 2 \rightarrow \frac{d}{dx} 2 = 0$

$I: \sin x \rightarrow \int dx = -\cos x \rightarrow \int -\cos x \, dx = -\sin x \rightarrow \int -\sin x \, dx = \cos x$

Signs: +, -, + $\int x^2 \sin x \, dx = (x^2)(-\cos x) - (2x)(-\sin x) + (2)(\cos x) + C = -x^2 \cos x + 2x \sin x + 2 \cos x + C = (2 - x^2) \cos x + 2x \sin x + C$

Signs: +, -, + $\int x^2 \sin x \, dx = (x^2)(-\cos x) - (2x)(-\sin x) + (2)(\cos x) + C = -x^2 \cos x + 2x \sin x + 2 \cos x + C = (2 - x^2) \cos x + 2x \sin x + C$

8. Problem: $\int \frac{\ln x}{x^2} \, dx$

Solution: Let $u = \ln x$ (L) and $dv =$

$\frac{1}{x^2}$, $dx = x^{-2}$, dx (A). Then
 $du = \frac{1}{x}$, dx and $v = \int x^{-2}$,
 $dx = \frac{x^{-1}}{-1} = -\frac{1}{x}$. Using
 $\int u \, dv = uv - \int v \, du$: $\int \frac{\ln x}{x^2}$, $dx = (\ln x) \left(-\frac{1}{x}\right) -$
 $\int \left(-\frac{1}{x}\right)$
 $\left(-\frac{1}{x}\right)$, $dx = -\frac{\ln x}{x}$
 $+ \int \frac{1}{x^2}$, $dx = -\frac{\ln x}{x} +$
 $\int x^{-2}$, $dx = -\frac{\ln x}{x} -$
 $\frac{1}{x} + C = -\frac{\ln x + 1}{x} + C$

9. Problem: $\int x^2 e^{3x} \, dx$

Solution: Tabular integration is ideal here.

D: $x^2 \rightarrow \frac{d}{dx} 2x$

$\rightarrow \frac{d}{dx} 2$

$\rightarrow \frac{d}{dx} 0$ I: e^{3x}

$\rightarrow \int dx \frac{1}{3} e^{3x}$

$\rightarrow \int dx \frac{1}{9} e^{3x}$

$\rightarrow \int dx \frac{1}{27} e^{3x}$

Signs: +, -, + $\int x^2 e^{3x} \, dx =$

$(x^2) \left(\frac{1}{3} e^{3x}\right) -$

$(2x) \left(\frac{1}{9} e^{3x}\right) +$

$$\begin{aligned}
 & (2) \left(\frac{1}{27} e^{3x} \right) + C = \\
 & \frac{x^2}{3} e^{3x} - \frac{2x}{9} e^{3x} + \\
 & \frac{2}{27} e^{3x} + C = e^{3x} \\
 & \left(\frac{x^2}{3} - \frac{2x}{9} + \right. \\
 & \left. \frac{2}{27} \right) + C = \frac{e^{3x}}{27} \\
 & (9x^2 - 6x + 2) + C
 \end{aligned}$$

10. Problem: $\int \cos(2x) e^x \, dx$

Solution: This is another case for cyclical integration by parts. Let $I = \int \cos(2x) e^x \, dx$. Choose $u = \cos(2x)$ (T) and $dv = e^x \, dx$ (E). Then $du = -2\sin(2x) \, dx$ and $v = \int e^x \, dx = e^x$. $I =$

$$(\cos(2x))(e^x) - \int e^x (-2\sin(2x) \, dx)$$

$$= e^x \cos(2x) + 2 \int e^x \sin(2x) \, dx$$

Now, let's evaluate $\int e^x \sin(2x) \, dx$

using integration by parts. Choose $u' = \sin(2x)$ (T) and $dv' = e^x \, dx$ (E). Then $du' = 2\cos(2x) \, dx$ and $v' = e^x$. $\int e^x \sin(2x) \, dx = (\sin(2x))(e^x) - \int e^x (2\cos(2x) \, dx)$

$$= e^x \sin(2x) - 2 \int e^x \cos(2x) \, dx = e^x \sin(2x) - 2I$$

Substitute this back into the equation for I :

$$I = e^x \cos(2x) + 2(e^x \sin(2x) - 2I)$$

$$I = e^x \cos(2x) + 2e^x \sin(2x) - 4I$$

Solve for I :

$$I + 4I = e^x \cos(2x) + 2e^x \sin(2x)$$

$$5I = e^x (\cos(2x) + 2\sin(2x))$$

$$I = \frac{1}{5} e^x (\cos(2x) + 2\sin(2x)) + C$$

Questions & Answers About integration by parts worksheet with answers

N o	Question	Answer
1	What is integration by parts, and why is it a crucial technique?	Integration by parts is a calculus technique used to find the integral of a product of two functions. It's derived from the product rule of differentiation and is essential when direct integration or substitution methods fail. The formula is $\int u \, dv = uv - \int v \, du$.
2	What's the 'liate' or 'ilate' rule, and how does it help choose 'u' and 'dv'?	The 'liate' (Logarithmic, Inverse trig, Algebraic, Trigonometric, Exponential) or 'ilate' (Inverse trig, Logarithmic, Algebraic, Trigonometric, Exponential) rule is a mnemonic to help choose the 'u' function in integration by parts. Generally, you pick 'u' as the function that appears first in the mnemonic, as its derivative often simplifies.

3	Can you give a simple example of integration by parts in action?	Certainly! To integrate $\int x * e^x dx$: let $u = x$ (algebraic) and $dv = e^x dx$. Then $du = dx$ and $v = e^x$. Applying the formula: $\int x e^x dx = x * e^x - \int e^x dx = x e^x - e^x + C$.
4	What are some common pitfalls or mistakes students make with integration by parts?	Common mistakes include incorrectly identifying 'u' and 'dv', making errors in differentiation or integration of 'du' and 'dv', and forgetting the '- $\int v du$ ' term. Careful application of the 'liate' rule and double-checking each step is crucial.
5	When should I consider using integration by parts instead of another integration method?	You should consider integration by parts when you have an integral that is a product of two functions where one function's derivative is simpler than the function itself, and the other function can be easily integrated. It's particularly useful for integrals involving logarithms, inverse trigonometric functions, or products of algebraic and exponential/trigonometric functions.
6	Are there any variations or advanced applications of integration by parts?	Yes, integration by parts can be applied iteratively if the integral doesn't simplify after the first application (e.g., integrating $x^2 * e^x$). It's also a fundamental concept used in deriving formulas for special functions and in solving differential equations.
7	How do I handle definite integrals using integration by parts?	For definite integrals, you apply the formula $\int[a,b] u dv = [uv]$ from a to b - $\int[a,b] v du$. Remember to evaluate the 'uv' term at the limits of integration and then solve the remaining definite integral.

8	What kinds of practice problems are most effective for mastering integration by parts?	Practice problems that vary the types of functions (algebraic, trigonometric, exponential, logarithmic, inverse trig) and require iterative application are most effective. Problems where you need to carefully choose 'u' and 'dv' according to the 'liate' rule are also excellent for building intuition.
9	Where can I find reliable worksheets and answers for practicing integration by parts?	Many reputable sources offer integration by parts worksheets with answers. University calculus websites, educational platforms like Khan Academy or Paul's Online Math Notes, and even textbooks often provide these resources. Searching for 'integration by parts practice problems with solutions' should yield good results.
