How to Insert Quotation Marks in Excel: A Comprehensive Guide

Excel is a powerhouse for data management and analysis, and sometimes, the simplest tasks can feel surprisingly complex. One of those tasks? Inserting quotation marks. Whether you're preparing data for import, creating labels, or just need to enclose text, knowing how to effectively use quotation marks in Excel can save you a lot of time and frustration. Let's dive into the world of quoting in Excel, exploring various methods and their applications.

Why Would You Need Quotation Marks in Excel?

Before we get to the "how," let's quickly touch upon the "why." You might find yourself needing quotation marks for a few common reasons:

1. **Text Formatting:** Sometimes, you just want to visually distinguish a piece of text.
2. **Data Import/Export:** Many file formats, especially CSV (Comma Separated Values), use quotation marks to enclose text fields that might contain commas or other special characters, ensuring data integrity.
3. **Formulas and Functions:** In Excel formulas, text strings must be enclosed in quotation marks to be recognized as text rather than cell references or numbers.
4. **Creating Labels or IDs:** You might need to generate unique identifiers or labels that are inherently text-based.
5. **SQL or Programming Context:** If you're preparing data for use in databases or programming scripts, proper quotation is often mandatory.

The Simplest Way: Manual Entry

For a single cell or a few cells, the most straightforward approach is manual entry. Simply click into the cell where you want to add quotation marks, type your text, and then surround it with the double quotation mark character (").

Example:

If you want the word "Hello" to appear in a cell, you would type:

```
= "Hello"
```

Or, if you're typing directly into the cell and want to *display* the quotation marks themselves:

```
"Hello"
```

Pro Tip: Be mindful of whether you want the quotation marks to be part of the *content* of the cell or if they are being used by Excel for a specific purpose (like in a formula). This distinction is crucial.

Adding Quotation Marks to Existing Text

This is where it gets more interesting. What if you have a column of text that you need to enclose in quotation marks? Typing them manually would be a nightmare. Thankfully, Excel offers several powerful ways to automate this.

Method 1: Using the CONCATENATE Function (or its modern sibling, CONCAT)

The `CONCATENATE` function (or the newer `CONCAT` function in Excel 2019 and Microsoft 365) allows you to join multiple text strings together. We can use it to join an opening quotation mark, the text from a cell, and a closing quotation mark.

How it Works:

Let's say your text is in cell A1. You can create a new column (e.g., column B) and enter the following formula in cell B1:

```
=CONCATENATE (" ", A1, " ")
```

Understanding the Formula:

1. `CONCATENATE` (or `CONCAT`): The function that joins text.
2. `""`: This is the clever part. To include a literal double quotation mark within a text string in an Excel formula, you need to *double it*. So, `"` becomes `""` when you want to represent a single quotation mark within the string itself. Therefore, `""` represents two literal double quotation marks – one for the opening quote and one for the closing quote that will enclose your cell's content.
3. `A1`: This is the cell containing the text you want to quote.
4. `""`: Again, this double-doubling is to represent the literal closing quotation mark.

After entering this formula in B1, you can drag the fill handle (the small square at the bottom-right of the selected cell) down to apply it to the rest of your data.

Using the Newer CONCAT Function:

The `CONCAT` function is more flexible and can accept a range of cells. However, for this specific task of adding quotes around individual cell contents, the syntax is very similar:

```
=CONCAT (" ", A1, " ")
```

Method 2: Using the Ampersand Operator (&)

The ampersand `&` is a shortcut for `CONCATENATE`. It's often considered more readable and quicker to type.

How it Works:

Using the same example where your text is in cell A1, the formula in cell B1 would be:

```
= " " & A1 & " "
```

The logic here is identical to the `CONCATENATE` function. We're concatenating (joining) an opening double quote, the content of A1, and a closing double quote. Remember, `""` is used to represent the literal double quotes you want to appear.

Method 3: Using TEXTJOIN (Excel 2019 and Microsoft 365)

The `TEXTJOIN` function is designed to join text with a specified delimiter. While it's typically used to join multiple cells into one string, it can be cleverly adapted for our quoting purpose, especially if you're joining the quotes *and* the content in a specific order.

However, for simply adding quotes around *individual* cell contents, `TEXTJOIN` isn't the most direct solution compared to `CONCATENATE` or the ampersand. Its primary strength is joining multiple pieces of text with a consistent separator.

Where `TEXTJOIN` *could* be useful is if you were, for example, creating a comma-separated list of quoted items. But for our primary goal of quoting each item individually, stick to the `CONCATENATE` or `&` methods.

Dealing with Quotation Marks within the Text Itself

What if your original text already contains quotation marks? For example, cell A1 might contain: "He said, "Hello!"". If you try to use the previous formulas directly, Excel will get confused because it sees the inner quotes as the end of the text string.

The Double-Double Trick Revisited

The solution is to double *all* the quotation marks that you want to appear literally in the final output. This includes the outer quotation marks you're adding and any inner quotation marks that were already present.

Example:

Cell A1 contains: He said, "Hello!"

You want the output to be: "He said, ""Hello!"""

Using the ampersand operator (`&`) in cell B1:

```
="""" & SUBSTITUTE(A1, """", """"""") & """"
```

Explanation:

1. `""""`: This adds the initial opening double quote for the entire string.
2. `SUBSTITUTE(A1, """", """"")`: This is the key. The `SUBSTITUTE` function finds all occurrences of a specific text string within another text string and replaces them with a different text string.
 1. `A1`: The cell containing the original text.
 2. `""""`: The text to find – a literal double quote. Again, we need `""""` to represent a single literal double quote within the formula's text argument.
 3. `""""""`: The text to replace it with – two literal double quotes. So, each single `"` in A1 will be replaced by `""`.
3. `""""`: This adds the final closing double quote for the entire string.

This formula effectively escapes any existing double quotes by doubling them, and then wraps the entire result in a new pair of double quotes.

Advanced Scenarios: Formulas and VBA

Using Formulas for Conditional Quoting

Sometimes, you might only want to add quotation marks if certain conditions are met. For instance, you might want to quote text entries but not numbers.

Let's say your data is in column A, and you want the quoted output in column B. We can use an `IF` statement:

```
=IF(ISTEXT(A1), CONCATENATE("""", A1, """"), A1)
```

Or with the ampersand:

`=IF(ISTEXT(A1), """" & A1 & """" , A1)`

Explanation:

1. `IF(ISTEXT(A1), ... , ...)`: Checks if the content of cell A1 is text.
2. `CONCATENATE(""" , A1, """)` (or `"""" & A1 & """"`): If `ISTEXT(A1)` is TRUE, this part executes, adding quotation marks around the text.
3. `A1`: If `ISTEXT(A1)` is FALSE (meaning it's a number, date, etc.), the original content of A1 is returned without quotes.

VBA: For Complex or Repetitive Tasks

For very large datasets or highly complex quoting requirements, Visual Basic for Applications (VBA) can be your best friend. You can write a simple macro to iterate through your selected range and add quotation marks.

A Simple VBA Example:

1. Press `Alt + F11` to open the VBA editor.
2. Go to `Insert > Module`.
3. Paste the following code:

```
Sub AddQuotesToSelection() Dim cell As Range For Each cell In Selection ' Check if the cell is not empty If Not IsEmpty(cell.Value) Then ' Escape existing quotes and add surrounding quotes cell.Value = """" & Replace(cell.Value, """", """"""") & """" End If Next cell End Sub
```

4. Close the VBA editor.
5. Select the cells you want to add quotation marks to.
6. Press `Alt + F8`, select `AddQuotesToSelection`, and click `Run`.

Note: This VBA code assumes you want to modify the original cells. If you want the output in a new location, you'd need to adjust the code to write to a different range.

Common Pitfalls and How to Avoid Them

1. **Confusing Double Quotes (""") with Single Quotes (")**: Excel formulas require double quotes for text strings. Single quotes are sometimes used in other contexts but generally won't work for enclosing text in Excel formulas.
2. **Forgetting to Double the Quotes in Formulas**: The most common mistake is typing `="" & A1 & ""` instead of `="""" & A1 & """"`. Remember, to include a literal double quote within a text string in a formula, you must double it.
3. **Overwriting Important Data**: When using formulas, they create a **link** to the original data. If you want the quoted text to be static, you'll need to copy the results of the formulas and then "Paste Special > Values" back over the original data or a new location.
4. **Handling Existing Quotes Incorrectly**: As shown in the `SUBSTITUTE` example, failing to escape existing quotes will lead to incorrect results or errors.

Converting Formulas to Static Values

Once you've used a formula (like `CONCATENATE` or `&`) to add quotation marks, the result is still a formula. If you need the actual text with quotes as static values (e.g., to export to a CSV file where the formulas won't be interpreted), follow these steps:

1. Select the cells containing the formulas you want to convert.
2. Copy the selected cells (`Ctrl + C` or `Cmd + C`).
3. Right-click on the same (or a different) location where you want the static values.
4. Choose "Paste Special".
5. In the Paste Special dialog box, select "Values" under the "Paste" section.
6. Click "OK".

This process replaces the formulas with their calculated results, leaving you with static text enclosed in quotation marks.

Conclusion

Inserting quotation marks in Excel might seem like a small detail, but mastering it can significantly improve your data handling efficiency. From simple manual entry to sophisticated formula manipulations and even VBA automation, Excel provides a robust set of tools to meet your quoting needs. Remember the golden rule of doubling your quotes within formulas, and you'll be well on your way to perfectly quoted data in no time!

Understanding Quotation Marks in Excel: Mastering Text Precision

Inserting quotation marks in Excel might seem like a small detail, but it plays a crucial role in preserving data integrity, enhancing readability, and ensuring accurate text formatting across spreadsheets. Whether you're entering names, quotes, or short phrases, using proper quotation marks helps Excel interpret and display content exactly as intended. This practice is especially vital when working with mixed data types—numbers, dates, and text—where clarity prevents misinterpretation and supports reliable analysis.

In Excel, quotation marks serve as delimiters that signal the start and end of text strings. When you enter text within quotation marks—typically double quotes (“ ”)—the program treats the enclosed content as a single textual unit rather than parsing it as numeric or formula data. This distinction becomes essential when merging strings with other data types, avoiding errors in concatenation, and maintaining consistent formatting in reports or dashboards. Without proper quotation marks, Excel may misread numbers as formulas or misinterpret text, leading to incorrect calculations or alignment issues.

When and How to Use Quotation Marks in Excel

To insert quotation marks, simply click a cell and type the text, using either double quotes (“ ”) or single quotes ('), though double quotes are universally supported and recommended for compatibility. For instance, entering “John Smith” ensures the cell displays the exact name as text, regardless of surrounding content. When combining numbers and text—such as combining a product code with a customer name—wrapping the name in quotes prevents Excel from interpreting it as part of a formula. For example, combining “SKU123” with “Hello” as ““SKU123” – Hello” preserves both elements clearly.

Another essential application is in date formatting, where quotation marks can preserve formatting even if Excel recognizes a cell differently. Entering “2024-10-05” as text avoids automatic date parsing that might alter formatting during sorting or filtering. Similarly, in categorical data—like “High Priority” or “In Progress”—quotes help Excel recognize these as discrete labels, improving sorting accuracy and visual clarity in pivot tables or conditional formatting rules.

Best Practices and Advanced Tips for Using Quotation Marks

For optimal results, always use consistent quotation marks throughout a worksheet—mixing single and double quotes can cause confusion, particularly when importing data from external sources. Macros and formulas often respect quotation marks, but vigilance is needed when referencing external files or linked data, which may override formatting. Additionally, when copying and pasting text, ensure quotes are included to preserve the intended display, especially when automating data processes or building dynamic reports.

Looking ahead, Excel's evolving capabilities continue to emphasize text precision, with improved support for Unicode characters and natural language processing. As users increasingly rely on Excel for complex data storytelling, mastering quotation mark usage ensures that textual elements remain accurate and professional across reports, dashboards, and collaborative environments. Whether you're building a simple inventory list or a sophisticated business intelligence tool, proper quotation handling remains a foundational skill that enhances both functionality and communication within spreadsheets. By embracing careful quotation mark practices, Excel users unlock more reliable, readable, and maintainable spreadsheets—turning everyday data management into a precise and powerful asset.

Mastering Quotation Marks in Excel: A Comprehensive Guide

In the dynamic world of data management and analysis, Microsoft Excel remains an indispensable tool for professionals across countless industries. While its prowess in numerical calculations is well-known, Excel also offers robust capabilities for handling text data. One of the most common yet often misunderstood aspects of working with text in Excel is the correct insertion and utilization of quotation marks. Whether you're importing data, creating formulas, or formatting reports, understanding **how to insert quotation marks in Excel** is a fundamental skill that can prevent errors and unlock greater functionality.

This in-depth guide will demystify the process, covering various scenarios and providing clear, actionable steps. We'll explore why quotation marks are crucial, the different types of quotation marks used, and practical methods for their implementation, from manual entry to advanced formula techniques. By the end of this article, you'll be equipped to confidently navigate any situation involving quotation marks in your Excel worksheets, improving data integrity and the efficiency of your workflow.

The Importance of Quotation Marks in Excel

Before diving into the "how," let's understand the "why." In Excel, quotation marks serve several critical purposes:

- Text Delimiters:** Most importantly, quotation marks (specifically, the double quote, ") tell Excel that the enclosed characters should be treated as text, not as formulas or numerical values. Without them, Excel might try to interpret your input as a number, a date, or attempt to execute a formula, leading to incorrect results or error messages.
- Exact Matches in Formulas:** In functions like VLOOKUP, XLOOKUP, MATCH, and others that perform lookups or comparisons, quotation marks are essential to specify the exact text string you are searching for or comparing against. For instance, searching for "Apple" requires it to be enclosed in quotes: "Apple".
- Literal Characters in Formulas:** When you need to include quotation marks *within* a text string in an Excel formula, it requires a special technique. This is a common point of confusion for many users.
- Data Import and Export:** When importing data from external sources (like CSV files) or exporting Excel data, quotation marks are often used to ensure that text fields containing commas or other special characters are correctly delimited and interpreted.

Methods for Inserting Quotation Marks in Excel

There are several ways to insert quotation marks into your Excel cells and formulas, depending on your specific needs. Let's explore each method in detail.

1. Manual Entry: The Straightforward Approach

The most intuitive method for **inserting quotation marks in Excel** for simple text entries is direct manual input. When typing directly into a cell:

1. **For Text:** Simply type your text and enclose it within double quotation marks. For example, typing "Project Alpha" into a cell will store the exact text "Project Alpha".
2. **For Numbers as Text:** If you need to store numbers as text (e.g., phone numbers with leading zeros, ZIP codes, or product IDs that might be misinterpreted as numbers), enclose them in quotation marks. For instance, "007" will be stored as text "007", preserving the leading zeros, whereas `007` would be displayed as `7`.

Caveat: This manual method is straightforward for static data. However, it becomes cumbersome when dealing with large datasets or when you need to dynamically generate text strings containing quotation marks within formulas.

2. Using Formulas to Insert Quotation Marks

When your text strings need to be dynamically generated or manipulated, Excel formulas become your best friend. Here are the primary formula-based techniques.

a) Concatenating Text with Quotation Marks

The `CONCATENATE` function (or its modern successor, `CONCAT` or the `&` operator) allows you to combine text strings. To include literal quotation marks within a concatenated string, you need to use a special trick: **double the double quote**.

Why double the quote? Because a single double quote within a text string in a formula is interpreted by Excel as the start or end of that text string. To tell Excel that you want a *literal* double quote character as part of your text, you provide two consecutive double quotes.

Example: Let's say you have "Product ID" in cell A1 and you want to create a label in another cell that reads: `The ID is "PRODUCT123"`. If "PRODUCT123" is in cell B1, you can use the following formula:

```
= "The ID is " & B1 & ""
```

Let's break this down:

1. "The ID is ": This is the literal text before the product ID.
2. &: This is the concatenation operator, used to join text strings.
3. B1: This refers to the cell containing "PRODUCT123".
4. &: Another concatenation operator.
5. " ": This represents a literal double quote character.
6. " ": This represents another literal double quote character.

The formula effectively joins "The ID is ", then the content of B1, and finally, a pair of double quotes to enclose the product ID. The result would be: The ID is "PRODUCT123".

Using `CONCATENATE` or `CONCAT`:

The same logic applies:

```
=CONCATENATE("The ID is ", B1, "", "")
```

or

```
=CONCAT("The ID is ", B1, "", "")
```

Note that in the `CONCATENATE`/`CONCAT` function, you list the text arguments separated by commas. The pair of double quotes `""` is repeated to represent a literal double quote.

b) Using the `CHAR` Function for Quotation Marks

An alternative and often more readable method, especially for complex formulas, is to use the `CHAR` function. The `CHAR` function returns the character specified by a number in the character set. The ASCII (and Unicode) code for a double quotation mark is 34.

Example: To achieve the same result as the previous example (`The ID is "PRODUCT123"`), where "PRODUCT123" is in cell B1:

```
= "The ID is " & CHAR(34) & B1 & CHAR(34)
```

Here's the breakdown:

1. "The ID is ": Literal text.
2. &: Concatenation operator.
3. CHAR(34): This inserts a single literal double quote character.
4. B1: The content of cell B1.
5. &: Concatenation operator.
6. CHAR(34): This inserts another single literal double quote character.

This formula results in: The ID is "PRODUCT123".

Advantages of `CHAR(34)`:

1. **Readability:** It clearly indicates that a quotation mark is being inserted.
2. **Consistency:** It avoids the potential confusion of doubling up quotes within string literals.
3. **Easier Debugging:** Formulas can be easier to read and troubleshoot.

3. Inserting Quotation Marks in Specific Excel Functions

Many Excel functions require text strings to be enclosed in quotation marks. This is standard practice for arguments that represent literal text values.

a) Lookup Functions (VLOOKUP, HLOOKUP, XLOOKUP, MATCH)

When performing exact lookups for text values, you must enclose the lookup value in double quotes. If you are looking for the text "New York" and it's not in a cell, but you want to hardcode it in your formula:

```
=VLOOKUP("New York", A1:B10, 2, FALSE)
```

If the text you are looking up is in another cell (e.g., cell D1), you don't use quotes around the cell reference:

```
=VLOOKUP(D1, A1:B10, 2, FALSE)
```

The `FALSE` argument ensures an exact match. For text comparisons, an exact match is usually what you want.

b) Text Functions (FIND, SEARCH, SUBSTITUTE, TEXTJOIN)

Many text manipulation functions also require text criteria within quotation marks.

1. **`FIND` and `SEARCH`**: To find the position of a substring within a larger string.

`=FIND("at", "The cat sat", 1)` returns 5.

2. **`SUBSTITUTE`**: To replace specific text within a string.

`=SUBSTITUTE("This is a test.", "is", "was")` returns "Thwas was a test.". If you wanted to replace "is" with "is ", you'd use: `=SUBSTITUTE("This is a test.", "is", "is ")`.

3. **`TEXTJOIN`**: This is a powerful function for joining text strings, and it can also handle delimiters.

If you want to join values from A1:A5 with each value enclosed in quotes and separated by a comma and space:

`=TEXTJOIN(", ", TRUE, "" & A1:A5 & "")`

Here, `"" & A1:A5 & ""` creates an array where each element from A1:A5 is surrounded by double quotes.

``TEXTJOIN`` then joins these with ", ". The ``TRUE`` argument tells it to ignore empty cells.

c) Conditional Formatting and Data Validation

When setting up rules for conditional formatting or data validation, you often use formulas. Text criteria in these formulas must be enclosed in quotation marks.

Conditional Formatting Example: Highlight cells in column A if they contain the exact text "Urgent".

1. Select the range in column A.
2. Go to Home > Conditional Formatting > New Rule.
3. Choose "Use a formula to determine which cells to format".
4. In the formula box, enter: `=A1="Urgent"` (assuming your selected range starts with A1).
5. Click Format and choose your desired formatting.

Data Validation Example: Allow only specific text entries (e.g., "Yes", "No", "Maybe") in cell B1.

1. Select cell B1.
2. Go to Data > Data Validation.
3. Under the "Settings" tab, choose "List" from the "Allow" dropdown.
4. In the "Source" box, enter: `"Yes", "No", "Maybe"`.
5. Click OK.

Note that for the Data Validation List Source, Excel implicitly treats comma-separated entries as text strings without requiring outer quotes, but if you were constructing this list dynamically with a formula in another cell, you would use the techniques described earlier.

4. Inserting Single Quotation Marks in Excel

While double quotes are primarily used to define text strings, single quotes (') have a more specific, albeit less common, use in Excel. A single quote typed at the beginning of a cell entry forces Excel to treat the entire entry as plain text, even if it looks like a number, date, or formula.

Example:

1. Typing ``123`` into a cell results in the number 123.

2. Typing `"123"` into a cell results in the text "123", preserving any leading zeros or special formatting you might need.
3. Typing `=SUM(A1:A5)` into a cell results in the sum of cells A1 through A5.
4. Typing `'=SUM(A1:A5)'` into a cell results in the literal text string "SUM(A1:A5)".

This is particularly useful when importing data where numbers might have leading zeros (like phone numbers or specific IDs) or when you want to display a formula in a cell as text rather than having Excel execute it.

5. Inserting Quotation Marks When Importing Data

When importing data from text files (like CSV - Comma Separated Values), quotation marks play a crucial role in defining text fields, especially when those fields contain commas or line breaks.

1. **Standard CSV Format:** Fields are separated by commas. If a text field itself contains a comma, it's typically enclosed in double quotes to prevent it from being misinterpreted as a field separator. For example: "Doe, John", "New York", 50000.
2. **Handling Quotes within Quoted Fields:** If a text field needs to contain a double quote character, it's usually escaped by doubling it up within the enclosing quotes. For example: "He said, ""Hello!""", "London", 60000. When Excel imports this, it correctly interprets "He said, "Hello!"" as the text value.

During the import process (File > Import > Text/CSV), Excel's import wizard usually handles these delimiters and enclosed text fields automatically. However, understanding this structure helps troubleshoot import errors.

Common Pitfalls and Troubleshooting

Navigating quotation marks in Excel can sometimes lead to errors. Here are a few common pitfalls and how to address them:

1. **Incorrectly Doubling Quotes:** Forgetting to double up quotes when you want a literal quote within a text string in a formula. Remember, to display ""Hello"", the formula needs to be " ""Hello"" " or `=CHAR(34) & "Hello" & CHAR(34)`.
2. **Missing Quotes in Text Arguments:** Forgetting to enclose text arguments in functions like `VLOOKUP`, `FIND`, or `IF` with quotation marks when they are not cell references. This will likely result in a `#NAME?` error.
3. **Confusing Single and Double Quotes:** Misunderstanding the role of single quotes. Use a leading single quote to force literal text entry. Use double quotes to define text strings within formulas and functions.
4. **Excel Interpreting Numbers as Text (or vice versa):** Be mindful of leading zeros. Use a single quote `'` or enclose numbers in double quotes `""` in manual entry if you need them to be treated as text.

Conclusion

Effectively **inserting quotation marks in Excel** is a fundamental skill that underpins accurate data handling and robust formula creation. Whether you're manually entering data, building complex calculations, or ensuring data integrity during imports, the techniques discussed—manual entry, concatenation with doubled quotes, the `CHAR(34)` function, and understanding their role in various Excel functions—provide you with the tools to master this aspect of the software.

By internalizing these methods, you can significantly reduce errors, improve the clarity of your spreadsheets, and enhance your overall productivity in Excel. Remember to practice these techniques in different scenarios, and soon, handling quotation marks will become second nature.

Questions & Answers About how to insert quotation marks in excel

No	Question	Answer
----	----------	--------

1	How do I easily add quotation marks around text in an Excel cell?	You can use the CONCATENATE function or the '&' operator. For example, to add quotes around text in cell A1, use <code>=CONCATENATE("","A1","")</code> or <code>=""&A1&""</code> in another cell. The <code>""</code> part inserts a literal double quote.
2	Can I put quotation marks around values from multiple Excel cells?	Yes! Combine the CONCATENATE function or '&' operator with cell references. For instance, to put quotes around text in A1 and A2 separated by a space, use <code>=CONCATENATE("","A1," """,A2,"")</code> or <code>=""&A1&" ""&A2&""</code> .
3	I'm trying to create a formula that includes text with quotation marks. How do I avoid errors?	When entering text with quotation marks within an Excel formula, you need to double each quotation mark. So, to include 'Hello "World"' in a formula, you'd type <code>"Hello ""World"""</code> .
4	What's the quickest way to add quotation marks to a whole column of data in Excel?	The fastest way is to use a helper column. In an adjacent empty column, enter the formula mentioned above (e.g., <code>=""&A1&""</code> for the first cell in your data column A) and drag the fill handle down to apply it to all rows. Then, you can copy and paste this new column as values over your original data if desired.
5	How do I insert a single quotation mark (apostrophe) in an Excel cell without it being interpreted as a number prefix?	Simply type the single quotation mark (') at the beginning of the cell. Excel will then treat the entire entry as text, preventing it from being interpreted as a number or date, and it will display the apostrophe in the cell.
