A Typical Problem Solving Approach in Elementary Algebra

Bittinger's textbook likely follows a structured approach to problem-solving, emphasizing understanding over rote memorization. A typical problem-solving strategy might involve these steps:

1. **Understand the problem:** Carefully read and analyze the problem to identify the unknown quantities and the given information.
- 2.

Translate the problem into an algebraic equation: Represent the unknown quantities using variables and translate the given information into an equation or inequality. 3. *Solve the equation or inequality:* Use algebraic techniques to isolate the variable and find its value. 4. *Check your solution:* Substitute the solution back into the original equation or inequality to ensure it satisfies the given conditions. 5. *Interpret the solution:* State the solution in the context of the original problem. Let's look at a simple example demonstrating these steps: **Problem:** John is twice as old as his brother, Tom. The sum of their ages is 30. How old is each brother? **Solution:** 1. **Understand:** We need to find John's and Tom's ages. We know John is twice as old as Tom and their ages add up to 30. 2. **Translate:** Let 'x' represent Tom's age. Then John's age is '2x'. The equation is: $x + 2x = 30$ 3. **Solve:** $3x = 30$; $x = 10$. Therefore, Tom is 10 years old, and John is 20 years old (2×10). 4. **Check:** $10 + 20 = 30$ (Correct) 5. **Interpret:** Tom is 10 years old, and John is 20 years old.
