Example: Suppose a store sells apples for \$1.50 per pound and oranges for \$2.00 per pound. If you want to spend no more than \$10 on fruits, how many pounds of apples and oranges can you buy? This problem can be represented by the inequality: $1.5x + 2y \leq 10$, where x represents the number of pounds of apples and y represents the number of pounds of oranges. By solving this inequality, we can find the combinations of apples and oranges that satisfy the budget constraint.
